Directional Verbs in Cantonese: A Typological and Historical Study

Carine Yuk-man Yiu

The Hong Kong University of Science and Technology

Talmy (1985, 2000b) classifies languages into verb-framed and satellite-framed languages based on whether path is expressed in the main verb or in the satellite. This study shows that Cantonese makes use of both directional verbs and directional complements to express path, exhibiting characteristics of both types of languages. Scholars suggest that Classical Chinese has undergone a typological shift from a verb-framed language to a satellite-framed language. It is observed that Cantonese differs from Mandarin in two aspects. First, the use of a directional verb to encode agentive motion events is found in Cantonese but not in Mandarin. Second, the degree of fusion between the verb and the directional complement in Cantonese is not as high as Mandarin. This study suggests that the differences can be best construed as various stages of typological transformation and grammaticalization the two dialects have undergone.

Key words: directional verbs, Cantonese, grammaticalization, typology of motion events

1. Talmy’s typology of motion events

Talmy (1985, 2000b) suggests that languages are classified into verb-framed languages and satellite-framed languages according to how path is encoded. While path is expressed in the verb in verb-framed languages (e.g. Romance, Semitic, Japanese, Tamil, Polynesian, Bantu, some branches of Mayan, Nez Perce and Caddo), it is specified in the satellite\(^1\) in satellite-framed languages (e.g. most Indo-European minus Romance,}

\(^{*}\) An earlier version of this paper was presented at the 16th International Conference on Yue Dialects (The Hong Kong Polytechnic University, December 15-16, 2011). I am grateful to Samuel H.-N. Cheung, Dingxu Shi, and the two anonymous reviewers of *Language and Linguistics* for their valuable suggestions and comments. All errors are of course my own. This work was supported by funding from the General Research Fund of the Research Grants Council of Hong Kong for the project entitled “Directional verbs in early Cantonese colloquial texts: A study of metaphorical extension and word order change” (Project No. 644608).

\(^{1}\) Talmy (2000b:222) notes that “the satellite to the verb…is the grammatical category of any
Finno-Ugric, Chinese, Ojibwa and Warlpiri).

(1) La botella salió flotando.
   the bottle exit floating
   ‘The bottle exited floating.’

(2) The bottle floated out.

Examples (1) and (2) show that path is expressed in the main verb salir ‘to exit’ in Spanish and in the verb particle out in English.

Scholars have held different views with regard to the typological status of Chinese. According to Talmy (2000b:109), Chinese is a satellite-framed language as path is expressed in a satellite. For example,

(3) 瓶子漂出了洞穴。
   Píngzi piāo chū le dòngxué.³
   bottle float exit ASP cave
   ‘The bottle floated out of the cave.’

constituent other than a nominal or prepositional-phrase complement that is in a sister relation to the verb root. The satellite, which can be either a bound affix or a free word, is thus intended to encompass all of the following grammatical forms: English verb particles, German separable and inseparable verb prefixes, Latin or Russian verb prefixes, Chinese verb complements, Lahu nonhead ‘versatile verbs’, Caddo incorporated nouns, and Atsugewi polysynthetic affixes around the verb root.’ In Chinese, a complement is a lexical word which is often a verb or an adjective, and which appears after the main verb, providing information regarding the result or state of an entity. When a directional verb follows a main verb, denoting the direction in which the movement specified by the main verb is carried out, it is traditionally referred to as a directional complement or a satellite in Talmy’s term.

² Talmy (2000b:103-109) states that satellites do not require a ground NP whereas prepositions do. Lamarre (2009a) points out that in Chinese prepositional phrases are neatly distributed before or after the verb according to the relationship they bear to the motion (if the prepositional phrase indicates the source or direction, it appears before the verb; if it denotes the goal, it occurs after the verb). In contrast, path satellites or directional complements appear only after the verb. Therefore, the categorical status of prepositions and that of path satellites do not overlap. To put it simply, directional complements are satellites rather than prepositions.

³ Pinyin, and Jyutping, developed by the Linguistic Society of Hong Kong, will be adopted for the romanizations of Mandarin and Cantonese examples. Also, the following list of abbreviations will be used in the discussion: ACC=accusative case, ASP=aspect marker, CL=classifier, DC=directional complement, DM=disposal marker, DS=different subject marker, GEN=genitive case, IMP=imperative, LOC=localizer, NOM=nominative case, NP=noun phrase, O=object, PF=perfective, PRED=predicate marker, PST=past tense, SFP=sentence-final particle, S=subject, SG=singular, SS=same subject marker, TOP=topic, V=verb and VP=verb phrase.
In example (3), manner is expressed in the main verb *piāo* 漂 ‘to float’ while path is incorporated in the satellite *chū* 出 ‘to exit’.

The following path satellites are listed in Talmy (2000b:109) for Chinese.4

-qù 去 ‘thither’
-lái 来 ‘hither’
-shàng 上 ‘up’
-xià 下 ‘down’
-jìn 進 ‘in’
-chū 出 ‘out’
-dào 到 ‘all the way (to)’
-dào 到 ‘atopple (i.e., pivotally over)’

Tai (2003) suggests, on the contrary, that directional complements *quxiang buyu* 趨向補語 should not be considered as satellites because they can serve as a main verb in the sentence. For example,

(4) John 飞过英吉利海峡。
John *fēi guò Yīngjílì Hǎixiá.*
John fly pass English Channel
‘John flew across the English Channel.’ (Tai 2003:309)

(5) John 过了英吉利海峡。
John *guò lè Yīngjílì Hǎixiá.*
John pass ASP English Channel
‘John crossed the English Channel.’ (Tai 2003:310)

(6) *John 飞了英吉利海峡。
John *fēi le Yīngjílì Hǎixiá.*
John fly ASP English Channel
‘John flew across the English Channel.’ (Tai 2003:310)

In examples (4) and (5), path is expressed in *guò* 過 ‘to pass’, which functions as a complement in (4) but as a main verb in (5). The grammaticality contrast in (5) and (6) illustrates that *guò* 過 ‘to pass’ in the former can stand alone as a main verb without the manner verb *fēi* 飞 ‘to fly’ while the use of *fēi* 飞 ‘to fly’ without *guò* 過 ‘to pass’ in (6) gives rise to ungrammaticality. Based on the facts presented in (4)-(6), Tai concludes

4 Thanks to the reviewer who has drawn my attention to the fact that the list is taken from Chao (1968).
that Chinese is primarily a verb-framed language as it encodes path in a verb.\(^5\)

Another proposal is put forward in Lamarre (2003), in which it is shown that Chinese is neither a verb-framed nor a satellite-framed language. Instead, it exhibits a split system of conflation in that whether path is encoded in the main verb or in the satellite depends on the type of events denoted. Precisely, when encoding an agentive motion event, path is expressed in the satellite; when expressing a self-agentive motion event, path can be specified in the main verb or in the satellite;\(^6\) and when denoting a non-agentive motion event, there is a tendency to express path in the satellite.\(^7\)

(7) 我把它扔进了废纸篓。
    Wǒ bā tā rēng jìn le fèizhǐlǒu.
    ‘I threw it into the wastepaper basket.’ (Lamarre 2003:6)

(8) 你回来。
    Nǐ huí lái.
    ‘You come back.’ (Lamarre 2003:7)

(9) 他走回来了。
    Tā zǒu huí lái le.
    ‘He walked back.’

(10) 河水流出来了。
    Hé shuǐ liú chū lái le.
    ‘The river water flew out.’

---

\(^5\) A reviewer has pointed out that fēi 飛 ‘to fly’ is mostly used intransitively but in some situations it can take a direct object, as in wǒ fēi Yīngguó 我飛英國 ‘I fly to England’, especially if the speaker is a pilot. The occurrence of a nominal after an intransitive verb and the semantic relationship held between the intransitive verb and the nominal seems to be determined by pragmatics or context rather than by syntax. For example, the noun Yīngguó 英國 ‘England’ in fēi Yīngguó 飛英國 ‘to fly to England’ denotes the destination while Guó tài 國泰 ‘Cathy Pacific’ in fēi Guó tài 飛國泰 ‘to fly Cathy Pacific’ represents the instrument. Since the issue is not directly related to the present study, I shall leave it for future exploration.

\(^6\) Agentive and self-agentive motion events are also referred to as caused and spontaneous motion events (cf. Choi & Bowerman 1991, Matsumoto 2003, Lamarre 2009a).

\(^7\) However, statistics are not provided for the observations in Lamarre (2003).
Example (7) represents an agentive motion event, a motion event in which the figure, i.e. _threads ‘it’, is caused by the external force, i.e. wǒ 我 ‘I’, to move into the wastepaper basket. The cause of the movement is denoted by the verb rēng 扔 ‘to throw’ whereas the path is expressed in the satellite or the directional complement jìn 进 ‘to enter’.

Examples (8) and (9) involve self-agentive motion events, motion events in which the figure, i.e. nǐ 你 ‘you’ or tā 他 ‘he’, carries out the movement intentionally. In both examples, huí 回 ‘to return’ denotes the semantic component of path. Syntactically, it serves as a main verb in the former but as a complement in the latter. Example (10) illustrates the use of a satellite to encode path in non-agentive motion events, in which the subject might or might not be caused by some unspecified entity to move in a certain direction.

Much effort has been put into investigating the typological status of Mandarin. However, important questions such as how other Chinese dialects express path and whether they behave in the same way as Mandarin are not addressed by scholars. This paper will provide a detailed description of the expression of path in another Chinese dialect — Cantonese, a regional variety of Chinese spoken mainly in the provinces of Guangdong and Guangxi. On the one hand, Cantonese resembles Mandarin in exhibiting both characteristics of verb-framed and satellite-framed languages in expressing path in the main verb or in the satellite. On the other hand, Cantonese shows a number of properties which are not observed in Mandarin such as the use of directional verbs to encode path in agentive motion events.8

8 Scholars have proposed that Talmy’s binary classification should be expanded to include a third type of languages, namely, equipollently-framed languages (cf. Slobin & Hoiting 1994, Zlatev & Yangklang 2004). In equipollently-framed languages, path and manner are both expressed by equivalent grammatical forms. In the following Thai example from Zlatev & Yangklang (2004:160):

chán d 相 n khām than ǒn khāw paj nai s วน
I-walk-cross-road-enter-go-in-park ‘I walked across the road and into the park’, while the main verb d 相 ‘to walk’ denotes manner, the verbs khām ‘to cross’, khāw ‘to enter’ and paj ‘to go’ denote non-deictic and deictic path. Similarly, Cantonese also exhibits the use of the serial verb construction. However, it is often difficult to determine whether the verbs in the serial verb construction in Cantonese have the same status. For example, the aspectual marker zo2 卒 is attached to the first verb ning1 擡 ‘to bring’ but not to the second verb lai4 喂 ‘to come’ in keoi5 ning1 zo2 bun2 syu1 lai4 佢擸嘅書嘅來 ‘S/he took a book’, while the progressive marker gan2 緊 is likely to be attached to the second verb se2 写 ‘to write’ than to the first verb or the coverb jung6 用 ‘to use’ in keoi5 jung6 zo2 sau2 se2 gan2 zi6 佢用左手寫緊字 ‘S/he is writing characters with her left hand.’ Because of the difficulty stated above, the present study will follow the bipartite classification of verb-framed and satellite-framed languages proposed by Talmy rather than adopting the tripartite scheme.
2. Previous works on directional verbs and directional complements in Cantonese

Iida (2001) divides directional verbs into two types, namely, the heoi³ 去 type and the soeng⁵ 上 type. The former includes lai⁴ 嘀 ‘to come’ and heoi³ 去 ‘to go’ while the latter consists of lok⁶ 落 ‘to descend’, jap⁶ 入 ‘to enter’, ceot¹ 出 ‘to exit’, gwo³ 過 ‘to pass’, faan¹ 翻 ‘to return’ and maai⁴ 埋 ‘to approach’. According to Iida, it is possible for di¹ 啲 to be combined with members of the soeng⁵ 上 type to express comparison (e.g. jap⁶ di¹ 入啲 ‘to move toward the inside a little bit’) but such a usage is not found in members of the heoi³ 去 type (e.g. *lai⁴ di¹ 嘀啲 ‘to move toward the speaker a little bit’). However, it is observed that some members of the soeng⁵ 上 type cannot be used with di¹ 啲 (e.g. *faan¹ di¹ 翻啲 ‘to move back a little bit’).¹⁰ As a result, the proposed distinction, i.e. the possibility to be used with di¹ 啲, fails to differentiate the two types of directional verbs.

He (2000) discusses the various word orders exhibited in a sequence that involves a main verb (V), an aspectual suffix (ASP), one or more than one directional complement (DC) and an object (O) such as V-ASP-DC (e.g. soeng⁵ zo² heoi³ 上咗去 ascend-ASP-go ‘ascended and away from the speaker’), V-ASP-DC-DC (e.g. haang⁴ zo² ceot¹ heoi³ 行咗出去 walk-ASP-exit-go ‘walked out and away from the speaker’), V-DC-O (e.g. geoi² hei² biu¹ jyu⁵ 舉起標語 lift-rise-sign ‘to lift up the sign’) and V-ASP-DC-O (e.g. haang⁴ zo² soeng⁵ lau² 行咗上樓 walk-ASP-ascend-floor ‘walked upstairs’). He further proposes a syntactic structure from which the various word orders are derived. In the proposed structure, the main verb and the first directional complement are under the same branch, which is a sister to the second directional complement. For example, tiu³ lok⁶ heoi³ 跳落去 jump-descend-go ‘to jump down and away from the speaker’ is schematically represented as: [V [V tiu³ lok⁶ heoi³]]. The question that immediately arises is why lok⁶ 落 ‘to descend’ and the main verb tiu³ 跳 ‘to jump’ form a unit instead of lok⁶ 落 ‘to descend’ and heoi³ 去 ‘to go’ as it is impossible to say *tiu³ lok⁶ 跳落 jump-descend ‘to jump down’. Lok⁶ heoi³ 落去 descend-go ‘to descend and away from the speaker’ in tiu³ lok⁶ heoi³ 跳落去 jump-descend-go ‘to jump down and away from the speaker’ is referred to as a compound directional complement in Cheung (2007). If an aspectual suffix is to appear, it will appear between the main verb tiu¹ 跳

---

⁹ The character for faan¹ ‘to return’ should be 返. However, the use of 翻 has become increasingly popular. In this study, the character 翻 rather than 返 will be used to refer to faan¹ with the meaning of ‘to return’.

¹⁰ In addition to members of the heoi³ 去 type, i.e. lai⁴ 嘀 ‘to come’ and heoi³ 去 ‘to go’, faan³ 翻 ‘to return’, dou¹ 到 ‘to arrive’ and hei² 起 ‘to rise’ also cannot be combined with di¹ 啲 to express comparison.
‘to jump’ and the compound directional complement *lok* superscript 6 落去 descend-go ‘to descend and away from the speaker’, as in *tiu* superscript 3 跳 *lok* superscript 6 heoi superscript 3 落去 descend-go ‘jumped down and away from the speaker’. The position in which *zo* 咭 appears further suggests that *lok* 落 ‘to descend’ and the main verb *tiu* 跳 ‘to jump’ do not form a unit but *lok* 落 ‘to descend’ and *heoi* 去 ‘to go’ do. The presence of an object further complicates the picture. While *zo* 咭 appears after the verb *haang* 行 ‘to walk’ in *haang* 行 *soeng* 上 *lau* 行 *上樓* walk-ASP-ascend-floor ‘walked upstairs’, it occurs after the directional complement *hei* 起 ‘to rise’ in *geoi* 起 *zo* 入 *biu* 擡起 lift-rise-ASP-sign ‘lifted up the sign’. The different positions in which *zo* 咭 appears seem to suggest that the relationship between the verb and the directional complement differs depending on the type of motion events that is involved, i.e. self-agentive vs. agentive motion events. Therefore, the different word orders exhibited might not be derived from a single underlying structure as proposed by He.

Cheung (2007) is one of the few comprehensive studies on directional complements in Cantonese, in which twelve directional complements are divided into three types of simple directional complements *jiandan de fangxiang buyu* 簡單的方向補語. The three types of simple directional complements are as follows:superscript 11

<table>
<thead>
<tr>
<th>Type 1</th>
<th>Type 2</th>
<th>Type 3</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>lai</em> 嘉 ‘to come’</td>
<td><em>soeng</em> 上 ‘to ascend’</td>
<td><em>faan</em> 翻 ‘to return’</td>

</tbody>
</table>

Two or three simple directional complements can be further combined to form a compound directional complement *fuhe de fangxiang buyu* 複合的方向補語. In a compound directional complement that is made up of two simple directional complements (hereafter referred to as double directional complements), a Type 2 complement or a Type 3 complement is followed by a Type 1 complement. The nineteen possible combinations

superscript 11 Scholars have different opinions with regard to the number of core directional verbs. Li Xinkui et al. (1995) include *dai* 低 ‘low’ in addition to the ones in Table 1 while Yuan (1995) excludes *dou* 高 ‘to arrive’.
of double directional complements are listed in Table 2 below:\textsuperscript{12}

**Table 2:** Double directional complements in Cantonese\textsuperscript{13}

<table>
<thead>
<tr>
<th>Type 1</th>
<th>Type 2</th>
<th>Type 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>soeng\textsuperscript{2} \textsuperscript{上} ‘to ascend’</td>
<td>lok\textsuperscript{6} \textsuperscript{落} ‘to descend’</td>
<td>ceot\textsuperscript{出} ‘to exit’</td>
</tr>
<tr>
<td>jap\textsuperscript{入} ‘to enter’</td>
<td>hoi\textsuperscript{閉} ‘to depart’</td>
<td>gwo\textsuperscript{過} ‘to pass’</td>
</tr>
<tr>
<td>maai\textsuperscript{埋} ‘to approach’</td>
<td>hei\textsuperscript{起} ‘to rise’</td>
<td>dou\textsuperscript{到} ‘to arrive’</td>
</tr>
<tr>
<td>faan\textsuperscript{翻} ‘to return’</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For compound directional complements that contain three simple directional complements (hereafter referred to as triple directional complements), a Type 3 complement is followed by a Type 2 and a Type 1 complement.\textsuperscript{16} The fourteen possible

\textsuperscript{12} Cheung (2007:119-122) does not mention gwo\textsuperscript{3} lai\textsuperscript{4} \textsuperscript{過嚟} pass-come ‘to pass over and toward the speaker’ and gwo\textsuperscript{3} heoi\textsuperscript{3} \textsuperscript{過去} pass-go ‘to pass over and away from the speaker’. But since they are possible combinations, we shall include them in our discussion. On the other hand, Cheung (2007) includes dou\textsuperscript{3} lai\textsuperscript{4} \textsuperscript{到嚟} arrive-come ‘to arrive and toward the speaker’ and dou\textsuperscript{3} heoi\textsuperscript{3} \textsuperscript{到去} arrive-go ‘to arrive and away from the speaker’ as possible combinations of double directional complements. However, it is observed that dou\textsuperscript{3} \textsuperscript{到} ‘to arrive’ behaves differently from the others. In particular, simple directional complements which can appear in double directional complements can also occur in triple directional complements except for dou\textsuperscript{3} \textsuperscript{到} ‘to arrive’ and hei\textsuperscript{2} \textsuperscript{起} ‘to rise’, of which the latter is seldom used even as a double directional complement as noted in Cheung. Therefore, it is not clear whether dou\textsuperscript{3} \textsuperscript{到} ‘to arrive’ in haang\textsuperscript{4} dou\textsuperscript{3} lai\textsuperscript{4} \textsuperscript{行到嚟} walk-arrive-come ‘to walk toward the speaker’ and haang\textsuperscript{4} dou\textsuperscript{3} heoi\textsuperscript{3} \textsuperscript{行到去} walk-arrive-go ‘to walk away from the speaker’ is a genuine directional complement or a complement marker. However, without further evidence, we shall include them in this study.

\textsuperscript{13} ‘+’ indicates that the combination is possible whereas ‘-’ means the combination is not possible.

\textsuperscript{14} According to Cheung (2007:121), hei\textsuperscript{2} lai\textsuperscript{4} \textsuperscript{起嚟} rise-come ‘to rise and toward the speaker’, as in tiu\textsuperscript{3} hei\textsuperscript{2} lai\textsuperscript{4} \textsuperscript{跳起嚟} jump-rise-come ‘to jump up and toward the speaker’, is seldom used as a double directional complement. Because of its low frequency of use, hei\textsuperscript{2} lai\textsuperscript{4} \textsuperscript{起嚟} rise-come ‘to rise and toward the speaker’ will be excluded from the following discussion on compound directional complements.

\textsuperscript{15} As noted in Cheung (2007:121), the use of hei\textsuperscript{2} heoi\textsuperscript{3} \textsuperscript{起去} rise-go ‘to rise and away from the speaker’ as a double directional complement does not seem to exist in Cantonese. But such a use is found in other dialects. Cf. fn.24.

\textsuperscript{16} Although ning\textsuperscript{1} faan\textsuperscript{1} hei\textsuperscript{2} lai\textsuperscript{4} \textsuperscript{撘翻起嚟} bring-return-rise-come ‘to bring back up and toward the speaker’ seems to be as good as the other triple directional complements such as ning\textsuperscript{1} faan\textsuperscript{1} gwo\textsuperscript{3} lai\textsuperscript{4} \textsuperscript{揹翻過嚟} bring-return-pass-come ‘to bring back over and toward the speaker’, faan\textsuperscript{1} hei\textsuperscript{2} lai\textsuperscript{4} \textsuperscript{翻起嚟} differs from triple directional complements in a number of ways. For example, the former does not allow a theme object to appear after the verb and before it such...
combinations of triple directional complements are shown in Table 3 below:

<table>

</tbody>
</table>

As noted above, Cheung’s (2007) discussion is one of the few comprehensive studies on directional complements found in the literature. It has drawn our attention to a number of interesting phenomena associated with directional complements such as the position of the aspect marker and the position of the directional complement in relation to a common noun object and a locative object and the order of simple directional complements in a compound directional complement. However, no discussion is provided to explain the above observations.

Yiu (2005) is to this day the most comprehensive study on the syntactic and semantic characteristics of directional verbs and directional complements in Cantonese. She addresses a number of issues raised but unexplained in Cheung (2007). For example, she divides the twelve directional verbs into three types, according to the component of a movement they project for, namely, source, path, and goal. She further shows that the order in which the simple directional complements appear reflects the temporal sequence in which a movement takes place. In addition, Yiu probably is the first one who has brought attention to the causative or agentive use of directional verbs in Cantonese (e.g. **lo⁶ da⁵ go³ coeng¹ lim² 落低個窗簾 descend-low-CL-curtain ‘to lower the curtain’), a use which indicates that the theme object is caused to move in the direction denoted by the directional verb. However, since the focus of her study is primarily on Cantonese,
some of the proposals made therein need to find further support from other Chinese dialects and languages.17

From the above discussion, it can be observed that previous works often focus on the syntactic and semantic characteristics associated with directional complements. Not much attention has been given to the core usage and meaning of directional verbs, i.e. their use as a main verb and their expression of the directional meaning, a task that will be undertaken in the next section.

3. Characteristics of directional verbs in Cantonese18

As noted in the last section, the study of Cheung (2007) includes the following twelve directional verbs: soeng⁵ ‘to ascend’, lok⁶ ‘to descend’, ceot⁴ ‘to exit’, jap⁶ ‘to enter’, hoï¹ ‘to depart’, maai⁴ ‘to approach’, gwo⁵ ‘to pass’, hei² ‘to rise’, dou³ ‘to arrive’, faan¹ ‘to return’, lai⁴ ‘to come’ and heoi³ ‘to go’. He further divides them into three types. However, no justification has been provided regarding the criteria adopted for the classification. This study will focus on the same group of directional verbs19 and classify them into two groups based on whether the location of the speaker is involved in defining the direction. While the direction of lai⁴ ‘to come’ and heoi³ ‘to go’ is defined in relation to the location of the speaker,20 the orientation point of the other directional verbs does not involve the location of the speaker. The former are referred to as deictic directional verbs whereas the latter are non-deictic directional verbs (cf. Lamarre 2008 and 2009a, Liu 2008). For example,

(11) 佢嚟/去辦公室。

Keoi⁵ lai⁴/heoi³ baan⁶gung¹sat¹.
s/he come/go office
‘S/he comes/goes to the office.’

---

17 Yuan (1995) is a detailed study on directional verbs and directional complements in Cantonese. However, the discussion focuses primarily on self-agentive motion events, details of which have been already outlined in this section. Therefore, a further elaboration of the article is not provided.

18 The Cantonese examples in this study were constructed by the author and their acceptability was checked against by speakers of Cantonese whose age ranges from twenty to seventy. The variety of Cantonese reflected in the examples represents the variety spoken in Hong Kong.

19 The directional verbs examined in this study belong to the group of verbs of inherently directed motion in Levin & Rappaport Hovav (1992).

20 Thanks to the reviewer who has drawn my attention to the fact that if the subject is ngo⁵ 我 ‘I’, the deictic reference would become the location of the addressee.
Directional Verbs in Cantonese: A Typological and Historical Study

(12) 佢上三樓。
   Keoi⁵ soeng⁵ saam¹ lau².
   ‘S/he ascends to the third floor.’

The directional verbs *lai* 唔 ‘to come’ and *heoi* 去 ‘to go’ in (11) indicate that the movement is toward and away from the location of the speaker, i.e. *baan⁶ gung¹ sat¹* 辦公室 ‘the office’, while the directional verb *soeng* 上 ‘to ascend’ in (12) specifies an upward movement toward the location denoted by the locative object *saam¹ lau²* 三樓 ‘the third floor’ and does not involve the location of the speaker.

There are three characteristics that distinguish the above directional verbs from verbs such as *hai* 唔 ‘to be at’, *hoeng* 向 ‘to face’, *sing* 升 ‘to rise’, *dit* 跌 ‘to drop’, *haang* 行 ‘to walk’ and *tiu* 跳 ‘to jump’, which denote state, direction, and movement. The three characteristics are: (i) the expression of motion, (ii) the ability to take a locative object, and (iii) the potential to form compound directional complements.

3.1 Expression of motion

The characteristic of expressing motion differentiates the twelve directional verbs in this study from verbs which indicate location or state such as *hai* 唔 ‘to be at’ and *hoeng* 向 ‘to face’.

(13) 佢上咗/過/緊三樓。
   Keoi⁵ soeng⁵ zo²/gwo³/gan² saam¹ lau².
   ‘S/he ascended/has ascended/is ascending to the third floor.’

(14) *本書咗/過/緊書架。
   Bun² syu¹ hai² zo²/gwo³/gan² syu¹ gaa².
   CL book be at ASP ASP ASP bookshelf
   ‘The book was/has been/is being on the bookshelf.’

(15) *個窗向咗/過/緊後院。
   Go³ coeng¹ hoeng³ zo²/gwo³/gan² hau⁶ jyun².
   CL window face ASP ASP ASP backyard
   ‘The window faced/has faced/is facing the backyard.’

One characteristic of movement verbs is that they can always be used with an aspectual suffix, such as the perfective aspectual suffix *zo²* 唸, which denotes the completion of an
event, the experiential suffix *gwo* 過, which emphasizes the notion of having undergone a certain experience in the past, and the progressive aspectual suffix *gan* 緊, which specifies the continuation of an event. In example (13), *soeng* 上 ‘to ascend’ specifies an upward movement, while in examples (14) and (15), neither *hai* 唔 ‘to be at’ nor *hoeng* 向 ‘to face’ implies any movement. Instead, *hai* 唔 ‘to be at’ indicates the location of the book, i.e. on the bookshelf, while *hoeng* 向 ‘to face’ denotes the state of the window, i.e. it is facing the backyard. As a result, only the directional verb *soeng* 上 ‘to ascend’ in (13) can be used with *zo* 呢, *gwo* 過 and *gan* 緊 whereas *hai* 唔 ‘to be at’ and *hoeng* 向 ‘to face’ in (14) and (15) cannot.\(^{21}\)

### 3.2 Ability to take a locative object

The second characteristic that differentiates the directional verbs studied from verbs such as *dit* 跌 ‘to fall’ and *saang* 生 ‘to grow’, which also denote direction, is that the former, in general, can take a locative object whereas the latter cannot.

\[
\begin{align*}
(16) \quad & \text{佢上三樓。} \\
& \text{Keoi} 5 \text{ soeng} 5 \text{ saam} 1 \text{ lau} 2.
\end{align*}
\]

s/he ascend third floor

‘S/he ascends to the third floor.’

\[
\begin{align*}
(17) \quad & \text{佢跌*(落)水。} \\
& \text{Keoi} 5 \text{ dit} 3 \text{ *(lok} 6) \text{ seoi} 2.
\end{align*}
\]

s/he fall descend water

‘S/he falls into the water.’

\[
\begin{align*}
(18) \quad & \text{啲樹枝生*(上)屋頂。} \\
& \text{Di} 1 \text{ syu} 6zi1 \text{ saang} 1 \text{ *(soeng} 5) \text{ uk} 1 \text{ deng} 2.
\end{align*}
\]

CL branch grow ascend house top

‘The branches grow up to the top of the house.’

Although the verbs *soeng* 上 ‘to ascend’, *dit* 跌 ‘to fall’ and *saang* 生 ‘to grow’ all denote direction, i.e. an upward movement in the cases of *soeng* 上 ‘to ascend’ and *saang* 生 ‘to grow’ and a downward movement in the case of *dit* 跌 ‘to fall’, only *soeng* 上 ‘to ascend’ can be immediately followed by the locative object *saam* lau 2 三樓 ‘the third floor’, whereas *dit* 跌 ‘to fall’ and *saang* 生 ‘to grow’ cannot be followed by the locative objects *seoi* 水 ‘the water’ and *uk* deng 2 屋頂 ‘the roof top’. Instead, a

\(^{21}\) The ability to be used with *zo* 呢, *gwo* 過 and *gan* 緊 is also observed in the other eleven directional verbs.
directional complement, i.e. *lok* 落 ‘to descend’ and *soeng* 上 ‘to ascend’, is used to introduce the locative object.\(^\text{22}\)

The characteristic of taking a locative object also differentiates most of the directional verbs of this study from movement verbs such as *haang* 行 ‘to walk’, *tiu* 跳 ‘to jump’, *paa* 爬 ‘to climb’, etc.

\begin{enumerate}
\item[(19)] Keoi 5 *haang* 4 *(jap)* fong 2.
\hspace{1cm} s/he walk enter room
\hspace{1cm} ‘S/he walks into the room.’

\item[(20)] Keoi 5 *tiu* 3 *(gwo)* zoeng 1 toi 2.
\hspace{1cm} s/he jump pass CL table
\hspace{1cm} ‘S/he jumps over the table.’

\item[(21)] Keoi 5 *paa* 4 *(soeng)* gok 3lau 2.
\hspace{1cm} s/he climb ascend attic
\hspace{1cm} ‘S/he climbs up to the attic.’
\end{enumerate}

In examples (19)-(21), the verbs *haang* 行 ‘to walk’, *tiu* 跳 ‘to jump’ and *paa* 爬 ‘to climb’ are referred to as verbs of manner of motion in Levin & Rappaport Hovav (1992), and they denote the manner in which the movements are carried out. For example, *haang* 行 ‘to walk’, *tiu* 跳 ‘to jump’ and *paa* 爬 ‘to climb’ all involve the use of feet. While *haang* 行 ‘to walk’ and *paa* 爬 ‘to climb’ specify that the feet are constantly in contact with some kind of surface, *tiu* 跳 ‘to jump’ implies that the feet are in contact with the surface at the starting point and at the endpoint of the movement but are lifted up in the air, having no contact with the surface along the path. These movement verbs differ from directional verbs in that no direction is encoded in them and they cannot themselves take a locative object.\(^\text{23}\) As a result, they have to rely on the use of a directional complement

\(\text{\^{\text{22}}}\) Except for *hei* 起 ‘to rise’ and *hoi* 開 ‘to depart’, the other ten directional verbs can be followed by a locative object. Moreover, Yiu (2005) notes that without a given context it is unnatural to omit the locative object of non-deictic directional verbs, e.g. ??*keoi* 5 *soeng* 5 *zo* 2 佢上咗 s/he-ascend-ASP ‘S/he ascended’. Such omission, nevertheless, is fine with deictic directional verbs, e.g. *keoi* 5 *lai* 4 *zo* 2 佢嚟咗 s/he-come-ASP ‘S/he came’. A similar observation is made in Lamarre (2009a) for Mandarin.

\(\text{\^{\text{23}}}\) It might be argued that *haang* 行 ‘to walk’, *tiu* 跳 ‘to jump’, and *paa* 爬 ‘to climb’ can be immediately followed by a locative object without the use of a directional complement, e.g. *haang* 4 *saan* 1 行山 walk-mountain ‘hiking’, *tiu* 3 *seoi* 2 跳水 jump-water ‘water-diving’ and
following directional complement, i.e. jap⁶ 入 ‘to enter’, gwo³ 过 ‘to pass’ and soeng⁵ 上 ‘to ascend’, to specify the direction of the movement and to serve as a link between them and the locative object.

3.3 Potential to form compound directional complements

The third characteristic that distinguishes the directional verbs studied from verbs that denote location, state, or direction is that a non-deictic directional verb can be followed by a deictic directional complement.²⁴ Furthermore, a non-deictic directional complement and a deictic directional complement can be combined to form a compound directional complement. In contrast, verbs which denote location, state, or direction in general cannot be followed by a deictic directional complement. Neither can they be combined with a deictic directional complement to form a compound directional complement.²⁵ For example,

(22) 佢就快上嚟 / 去 (三樓)。
Keoi⁵ zau⁶ faai³ soeng⁵ lai⁴/heoi³ (saam¹ lau²).
s/he then quick ascend come/go third floor
‘S/he will soon ascend and toward/away from the speaker (to the third floor).’

²⁴ All non-deictic directional verbs, except for hei² 起 ‘to rise’ and dou³ 到 ‘to arrive’, can be followed by either of the two deictic directional complements, i.e. lai⁴ 嚏 ‘to come’ or heoi³ 去 ‘to go’. However, the combinations of qilāi 起來 and qilì 起去 are found in other Chinese dialects such as Minnan and Guizhou Dafanghua (cf. Li 1998).

²⁵ Although some verbs which denote manner and movement such as paa⁴ 爬 ‘to climb’ might be combined with lai⁴ 嚏 ‘to come’ and heoi³ 去 ‘to go’, as in paa⁴ lai⁴/heoi³ 爬嚏/去 ‘to crawl toward the speaker or away from the speaker’, the resulting combination cannot function as a compound complement of a main verb, e.g. *haang⁴ paa⁴ lai⁴/heoi³ 行爬嚏/去 walk-crawl-come/go.
Directional Verbs in Cantonese: A Typological and Historical Study

(23) 佢就快行上嚟/去(三樓)。
Keoi⁵ zau⁶ faai³ haang⁴ soeng⁵ lai⁴/heoi³ (saam¹ lau²).
s/he then quick walk ascend come/go third floor
‘S/he will soon walk up and toward/away from the speaker (to the third
floor).’

(24) *本書喺嚟/去書架。
Bun² syu¹ hai² lai⁴/heoi³ syu¹ gaa².
CL book be at come/go bookshelf
‘The book is on the bookshelf.’

(25) *個窗向嚟/去後院。
Go³ coeng¹ hoeng³ lai⁴/heoi³ hau⁷ jyun².
CL window face come/go backyard
‘The window faces the backyard and toward/away from the speaker.’

(26) *佢跌嚟/去水。
Keoi⁵ dit³ lai⁴/heoi³ seoi².
s/he fall come/go water
‘S/he falls into the water and toward/away from the speaker.’

(27) *啲樹枝生嚟/去屋頂。
Di¹ syu⁶zi¹ saang¹ lai⁴/heoi³ uk¹ deng².
CL branch grow come/go house top
‘The branches grow toward the top of the house and toward/away from the
speaker.’

(28) *架火箭就快升嚟/去天空。
Gaa³ fo⁷zin³ zau⁶ faai³ sing¹ lai⁴/heoi³ tin¹ hung¹.
CL rocket then quick rise come/go sky
‘The rocket will soon be launched toward the sky and toward/away from the
speaker.’

In example (22), the main verb soeng⁵ 上 ‘to ascend’ can be followed by the complements lai⁴ 嚟 ‘to come’ and heoi³ 去 ‘to go’, which specify whether the speaker is or is not at the destination of the movement. Example (23) shows that the combinations of soeng⁵ lai⁴ 上嚟 ascend-come ‘to ascend and toward the speaker’ and soeng⁵ heoi³ 上去 ascend-go ‘to ascend and away from the speaker’ can function as a complement of the main verb haang⁴ 行 ‘to walk’. It should be noted that when lai⁴ 嚟 ‘to come’ or heoi³ 去 ‘to go’ are combined with the non-deictic directional verbs or non-deictic directional complements, the locative objects can be omitted without giving rise to ungrammaticality. The presence
of the locative object serves to pinpoint the location of the speaker, without which the
deictic directional complement indicates only that the movement is toward the speaker
(in the case of *lai* 唔 ‘to come’) or away from the speaker (in the case of *heoi* 去 ‘to
go’). In examples (24)-(28), none of the verbs, i.e. *hai* 睇 ‘to be at’, *hoeng* 向 ‘to face’,
*dit* 跌 ‘to fall’, *saang* 生 ‘to grow’ and *sing* 升 ‘to rise’, can be followed by either of
the two deictic directional complements. Neither can they be combined with a deictic
directional complement to form a compound directional complement.26

4. The use of directional verbs in Cantonese

This section will examine the use of Cantonese directional verbs in self-agentive
and agentive motion events. In a self-agentive motion event, the subject refers to a
volitional entity which carries out the movement at his/her own will, while the object (if
any) denotes a location. In an agentive motion event, the subject is an agent who causes
another entity to move in a certain direction and the orientation point might or might not
manifest itself as a locative object in the sentence.

4.1 Self-agentive motion events

In a self-agentive motion event, the directional verb denotes the direction of the
movement undergone by the subject or theme. A movement is made up of three
components, namely, the source, the path, and the goal, as illustrated in Figure 1.

```
Source Path Goal
```

**Figure 1:** Three components of a movement

---

26 The verbs and the deictic directional complements in (24)-(28) cannot be combined to form
compound directional complements. Therefore, examples such as *bun* 本書 放喺嚟書架
CL-book-put-at-come-bookshelf ‘The book is placed on the
bookshelf and toward the speaker’, *go* 窗 面 向 唸
CL-window-blow-face-come-backyard ‘The window faces the backyard and toward the speaker
as a result of X’s blowing on it’, *heoi* 佢跳 跌 去 水
s/he-jump-fall-go-water ‘S/he jumps into the water and away from the speaker’, *dit* 佢 跌 落 去
CL-branches-grow-grow-go-roof top ‘The branches grow toward the roof top and away from the speaker’, *gaa* 箭 就 快 射 升 去
CL-racket-then-soon-shoot-rise-go-sky ‘The rocket will soon be launched
toward the sky and away from the speaker’ are ungrammatical.
The source is the location in which a movement starts; the path is the course of the movement; and the goal is the location at which the movement ends. The meaning of a directional verb thus includes an inherently specified source (such as hei² 起 ‘to rise’), goal (such as dou³ 到 ‘to arrive’, faan¹ 翻 ‘to return’, lat⁴ 嘆 ‘to come’ and heoi³ 去 ‘to go’) or path (such as soeng⁵ 上 ‘to ascend’, lok⁶ 落 ‘to descend’, ceot¹ 出 ‘to exit’, jap⁶ 入 ‘to enter’, hoi¹ 開 ‘to depart’, maai⁴ 埋 ‘to approach’, gwo³ 過 ‘to pass’). In Cantonese, one of the ways to express comparison is by using the classifier di¹ 啲 after adjectives such as gou¹ di¹ 高啲 ‘higher’. Table 4 below shows that directional verbs in the left-hand column, i.e. those whose meaning includes an inherently specified path, can be used with di¹ 啲 but those in the right-hand column, i.e. those whose meaning involves an inherently specified source and goal, cannot.

Table 4: Directional verbs and di¹ 啲

<table>
<thead>
<tr>
<th>Directional verbs compatible with di¹ 啲</th>
<th>Directional verbs incompatible with di¹ 啲</th>
</tr>
</thead>
<tbody>
<tr>
<td>soeng⁵ 上 ‘to ascend’</td>
<td>hei² 起 ‘to rise’</td>
</tr>
<tr>
<td>lok⁶ 落 ‘to descend’</td>
<td>dou³ 到 ‘to arrive’</td>
</tr>
<tr>
<td>ceot¹ 出 ‘to exit’</td>
<td>faan¹ 翻 ‘to return’</td>
</tr>
<tr>
<td>jap⁶ 入 ‘to enter’</td>
<td>lat⁴ 嘆 ‘to come’</td>
</tr>
<tr>
<td>hoi¹ 開 ‘to depart’</td>

</tr>
<tr>
<td>maai⁴ 埋 ‘to approach’</td>
<td></td>
</tr>
<tr>
<td>gwo³ 過 ‘to pass’</td>
<td></td>
</tr>
</tbody>
</table>

A comparison can be made only when two or more than two entities are involved. A path involves a number of points or locations traversed by the theme. As a result, the height (e.g. soeng⁵ di¹ 上啲 ‘higher’), the closeness (e.g. maai⁴ di¹ 埋啲 ‘closer’), etc., of those points can be compared. In contrast, directional verbs in the right-hand column involve only one single point, i.e. the source or the goal; therefore, a comparison between the points is impossible. Moreover, the difference in the inherently specified component of a movement projected by directional verbs is also exemplified in their locative object. Except for hoi¹ 開 ‘to depart’ and maai⁴ 埋 ‘to approach’, the rest in the left-hand column can have a locative object which denotes the path of a movement (cf. (29)-(33)) while those in the right-hand column, except for hei² 起 ‘to rise’, can only have a goal object (cf. (34)-(37)).

27 Lamarre (2008) notes that in Mandarin qì 起 ‘to rise’ is source-oriented while shàng 上 ‘to ascend’ is goal-oriented.

28 As noted in §2 above, a similar observation is made in Iida (2001).
(29) 佢上緊樓梯。
Keoi⁵ soeng² gan² lau⁴ tai¹.
s/he ascend ASP staircase
’S/he is ascending along the staircase.’

(30) 佢落緊樓梯。
Keoi⁵ lok⁶ gan² lau⁴ tai¹.
s/he descend ASP staircase
’S/he is descending along the staircase.’

(31) 佢出咗閘。
Keoi⁵ ceot¹ zo² zaap⁶.
s/he exit ASP gate
’S/he exited through the gate.’

(32) 佢入咗閘。
Keoi⁵ jap⁶ zo² zaap⁶.
s/he enter ASP gate
’S/he entered through the gate.’

(33) 佢過咗海。
Keoi⁵ gwo³ zo² hoi².
s/he pass ASP sea
’S/he crossed the sea.’

(34) 佢到咗辦公室。
Keoi⁵ dou³ zo² baan⁶ gung¹ sat¹.
s/he arrive ASP office
’S/he arrived at the office.’

(35) 佢翻咗辦公室。
Keoi⁵ faan¹ zo² baan⁶ gung¹ sat¹.
s/he return ASP office
’S/he returned to the office.’

(36) 佢嚟咗我屋企。
Keoi⁵ lai⁴ zo² ngo⁵ uk¹ kei⁵.
S/he come ASP my house
’S/he came to my house.’

(37) 佢去咗我屋企。
Keoi⁵ heoi³ zo² ngo⁵ uk¹ kei⁵.
s/he go ASP my house
’S/he went to my house.’
The locative object of *soeng* 上 ‘to ascend’, *lok* 落 ‘to descend’ and *ceot* 出 ‘to exit’ can also refer to the source of a movement.29

(38) 佢上咗水。  
Keoi⁵ soeng⁵ zo² seoi².  
s/he ascend ASP water  
‘S/he ascended from the water (to the shore).’

(39) 佢落咗車。  
Keoi⁵ lok⁶ zo² ce¹.  
s/he descend ASP car  
‘S/he moved out from the car.’

(40) 佢出咗課室。  
Keoi⁵ ceot¹ zo² fo³ sat¹.  
s/he exit ASP classroom  
‘S/he exited from the classroom.’

In the above self-agentive examples, path is denoted by the directional verbs, a characteristic which is associated with verb-framed languages. The next section discusses the use of directional verbs to encode path in agentive motion events, a use of directional verbs which is in general not exhibited in Mandarin and which has not been systematically studied by scholars.

4.2 Agentive motion events

In an agentive motion event, the directional verb refers to the action which is carried out intentionally by the agent subject and which causes the theme object to move in a certain direction, as illustrated in (41)-(46) below:30

29 When *hoi* 開 ‘to depart’ appears in the compound form *lei*hoi 離開 ‘to leave’, it can be followed by a locative object which denotes the source of the movement *lei*hoi⁵ baan⁶ gung¹ sat¹ 離開辦公室 ‘to leave the office’.

30 *Maai*埋 ‘to approach’, *gwo*過 ‘to pass’, *dou*到 ‘to arrive’, *faan*翻 ‘to return’ and *lai*嚟 ‘to come’, in general, do not take a theme object. Therefore, they are excluded from the discussion here. Also, in some cases, when a directional verb is followed by a theme object, a metaphorical meaning rather than a directional meaning is conveyed. For example, *hei*起 ‘to rise’ in *hei*san 起身 ‘to get up’ expresses the meaning of causing the body to be in an upright position. However, in *hei*gaan¹ uk¹ 起間屋 ‘to build a house’, *hei*起 expresses the metaphorical meaning of ‘to build’ rather than the directional meaning of ‘to rise’. Metaphorical meanings of directional verbs are excluded from the discussion here.
佢上咗三箱貨喺個架。s/he ascend ASP three CL goods at CL shelf LOC ‘S/he moved three boxes of goods up onto the shelf.’

佢落咗糖喺杯咖啡。s/he descend ASP sugar at CL coffee LOC ‘S/he put sugar into the cup of coffee.’

佢出咗三張牌喺檯。s/he exit ASP three CL card at table LOC ‘S/he put three cards onto the table.’

佢入咗啲錢喺個信封。s/he enter ASP CL money at CL envelope LOC ‘S/he put the money into the envelope.’

佢開咗架船去碼頭。s/he depart ASP CL ship go pier LOC ‘S/he sailed the ship to the pier.’

啲洗粉去咗啲漬出嚟。CL detergent go ASP CL stain exit come ‘The detergent removed the stain.’

In (41)-(46), except for the orientation point of heoi^3 去 ‘to go’ in (46) which is manifested as the compound directional complement ceot^1 lai^4 出嚟 exit-come ‘to exit and toward the speaker’, those of the others are spelt out as the objects of the preposition hai^2 嘅 ‘at’ or are introduced by a directional complement such as heoi^3 去 ‘to go’ in (45). That the directional verbs in (41)-(46) function as a main verb can be

---

31 It is noted above that the meaning of hei^2 起 ‘to rise’ is source-oriented. As a result, it cannot have a goal object. On the other hand, hei^2 起 ‘to rise’ can have a prepositional phrase which appears in front of it, indicating the location at which the change of state takes place, e.g. keoi^6 hai^2 del^4 haa^4 dou^6 hei^2 zo^2 san^2 佢喺地下度起咗身 s/he-at-floor-LOC-rise-ASP-body ‘S/he got up from the floor.’ The prepositional phrase hai^2 del^4 haa^4 dou^6 嘅地下度 at-floor-LOC ‘on the floor’, however, cannot occur after hei^2 san^1 起身 rise-body ‘to get up’, referring to the
seen by their use with the perfective aspectual suffix zo\(^2\) 咗. Furthermore, they can also have a complement, as in (47)-(51), or a verbal particle,\(^{32}\) as in (52).

(47) 佢上漏咗三箱貨喺個貨架。 Keoi\(^5\) soeng\(^5\) lau\(^6\)  zo\(^2\) saam\(^1\) soeng\(^1\) fo\(^3\) hai\(^2\) go\(^3\) fo\(^3\) gaa\(^2\) (dou\(^6\)). s/he ascend leave out ASP three CL goods at CL goods shelf LOC ‘S/he moved three boxes of goods less up onto the shelf.’

(48) 佢落錯咗包鹽喺杯咖啡。 Keoi\(^5\) lok\(^6\) co\(^3\) zo\(^2\) bau\(^1\) jim\(^4\) hai\(^2\) bui\(^1\) gaa\(^3\)fe\(^1\) (dou\(^6\)). s/he descend wrong ASP CL salt at CL coffee LOC ‘S/he wrongly put the packet of salt in the cup of coffee.’

(49) 佢出多咗三張牌喺檯。 Keoi\(^5\) ceot\(^1\) do\(^1\) zo\(^2\) saam\(^1\) zoeng\(^1\) paai\(^2\) hai\(^2\) toi\(^2\) (dou\(^6\)). s/he exit more ASP three CL card at table LOC ‘S/he put three more cards onto the table.’

(50) 佢入翻十蚊喺個信封。 Keoi\(^5\) jap\(^6\) faan\(^1\) sap\(^6\) man\(^1\) hai\(^2\) go\(^3\) seon\(^3\)fung\(^1\) (dou\(^6\)). s/he enter return ten dollar at CL envelope LOC ‘S/he put ten dollars back into the envelope.’

(51) 佢開遲咗架船去碼頭。 Keoi\(^5\) hoi\(^1\) ci\(^4\) zo\(^2\) gaa\(^3\) syun\(^4\) heoi\(^3\) maa\(^4\)tau\(^4\) (dou\(^6\)). s/he depart late ASP CL ship go pier LOC ‘S/he sailed the ship to the pier late.’

(52) 啲洗粉去哂啲漬出嚟。 Di\(^1\) sai\(^2\)fan\(^2\) heoi\(^3\) saai\(^3\) di\(^1\) zik\(^1\) ceot\(^1\) lai\(^4\). CL detergent go all CL stain exit come ‘The detergent removed completely the stain.’

destination after the change of state takes place. Another point to note is that it also seems possible to say that hoi\(^1\) 開 ‘to depart’ and heoi\(^3\) 去 ‘to go’ in the above examples express the metaphorical meanings of ‘to sail’ and ‘to remove’. However, since a simple/compound directional complement can be used in the sentences to denote the destination (cf. (45)-(46) and (51)-(52)), I shall assume that hoi\(^1\) 開 ‘to depart’ in (45) and (51) and heoi\(^3\) 去 ‘to go’ in (46) and (52) specify physical movements.\(^{32}\) According to Matthews & Yip (1994), verbal particles are grammatical words whose functions resemble those of phrasal verbs in English.
The basic word order in Cantonese is SVO. When the resultant state of the object is to be highlighted, the disposal construction is used. In the Cantonese disposal construction, the patient object is moved to the preverbal position and is marked by the disposal marker *zoeng*.

The preposed object has to be specific while the verb cannot be bare. One major difference between Cantonese and Mandarin in the use of the disposal construction is that the verb has to be transitive in the former but can be transitive or intransitive in the latter. For example, when a transitive verb such as *daa* 'to hit' in Cantonese or *dà* 'to hit' in Mandarin is involved in the disposal construction, the Cantonese sentence *keoi5 zoeng1 zek3 man1 daa2 sei2 zo* `佢將隻蚊打死 s/he-DM-CL-mosquito-hit-die-ASP 'S/he killed the mosquito by hitting it' and the Mandarin equivalent *tā bà wénzi dǎ sǐ le* `他把蚊子打死了 he-DM-mosquito-hit-die-SFP 'He killed the mosquito by hitting it' are both acceptable. In contrast, Mandarin allows an intransitive verb to be used as the main verb in the disposal construction *tā bǎ ge zéi pǎo diào le* `他把個賊跑掉了 he-DM-CL-thief-run-away-SFP 'He let the thief run away', whereas Cantonese does not, *keoi5 zoeng1 go3 caak2 zau2 lat1 zo* `佢將個賊走甩 s/he-DM-CL-thief-run-away-ASP 'S/he let the thief run away'. The use of the directional verbs in the disposal constructions in (53)-(58) suggests that the directional verbs resemble transitive verbs when they are used causatively. For example,

(53) 佢將三箱貨上漏咗嚟個架(度)。
Keoi5 zoeng1 saam1 soeng1 fo3 soeng5 lau6 zo2 hai2 go3 fo3 s/he DM three CL goods ascend leave out ASP at CL goods gaa2 (dou6).

The semantic roles borne by the subject and the object of a directional verb in self-agentive and agentive motion events are summarized in Table 5 below:

Table 5: The semantic roles borne by the subject and the object of a directional verb

This section has shown that directional verbs can be used to encode path in both self-agentive and agentive motion events, a characteristic which is exemplified in verb-framed languages. It will be illustrated in §5 that Cantonese also exhibits the characteristic of satellite-framed languages in expressing path in a satellite or a directional complement.

5. The use of simple directional complements in Cantonese

In addition to functioning as a main verb, a directional verb can also appear after another verb as a complement in self-agentive and agentive motion events.

5.1 Self-agentive motion events

In self-agentive motion events, the main verb denotes the manner in which the movement is carried out. The simple directional complement denotes the direction of the movement and provides the movement with an endpoint either by introducing a locative object for the main verb (in cases of non-deictic directional complements) or

---

33 It is mentioned in fn.22 that the directional verbs *heï²* 起 ‘to rise’ and *hoï¹* 會 ‘to depart’ cannot take a locative object. Such a property is also exhibited when they function as a simple directional complement. Therefore, they are excluded from the discussion on self-agentive motion events.
by defining the direction of the movement in relation to the speaker’s location (in cases of deictic directional complements). While the theme subject is the entity that undergoes a change of location, the locative object often represents the goal of the movement.

(59) 佢跑咗*(上)三樓。

Keoi⁵ paau² zo² *(lok⁶) saam¹ lau².
s/he run ASP descend third floor
‘S/he ran down to the third floor.’

(61) 佢行咗*(出)客廳。
Keoi⁵ haang⁴ zo² *(ceot¹) haak³ teng¹.
s/he walk ASP exit living room
‘S/he walked out into the living room.’

(62) 佢行咗*(入)房。
Keoi⁵ haang⁴ zo² *(jap⁶) fong².
s/he walk ASP enter room
‘S/he walked into the room.’

(63) 佢跳咗*(埋)呢邊。
Keoi⁵ tiu³ zo² *(maai⁴) nei¹ bin¹.
s/he jump ASP approach this side
‘S/he jumped to this side.’

(64) 佢行咗*(過)辦公室。³⁴
Keoi⁵ haang⁴ zo² *(gwo³) baan⁶ gung¹ sat¹.
s/he walk ASP pass office
‘S/he walked over to the office.’

³⁴ It is not clear why, when gwo³ 過 expresses the meaning of ‘to pass’, zo² 咭 appears after the V-gwo³ 過 combination such as keoi⁵ haang⁴ gwo³ zo² baan⁶ gung¹ sat¹ 佢行過辦公室 s/he-walk-pass-ASP-office ‘S/he walked past the office’; and when gwo³ 過 means ‘to pass over’ such as keoi⁵ haang⁴ zo² gwo³ baan⁶ gung¹ sat¹ 佢行咗過辦公室 s/he-walk-ASP-pass over-office ‘S/he walked over to the office’, zo² 咭 occurs between the verb and gwo³ 過 ‘to pass over’. 
Directional Verbs in Cantonese: A Typological and Historical Study

(65) 佢爬*(到)咗山頂。35  
Keoi⁵ paa⁴ *(dou³) zo² saan¹ deng².  
s/he climb arrive ASP hill top  
’S/he climbed to the top of the hill.’

(66) 佢遊*(翻)咗岸邊。  
Keoi⁵ jau⁴ zo² *(faan¹) ngon⁶ bin¹.  
s/he swim ASP return shore side  
’S/he swam back to the shore.’

(67) 佢跑*(嚟)終點。  
Keoi⁵ paau² zo² *(lai⁴) zung¹ dim².  
s/he run ASP come finishing line  
’S/he ran to the finishing line and toward the speaker.’

(68) 佢跑*(去)終點。  
Keoi⁵ paau² zo² *(heoi³) zung¹ dim².  
s/he run ASP go finishing line  
’S/he ran to the finishing line and away from the speaker.’

In examples (59)-(68), the action verbs paau² 跑 ‘to run’, haang⁴ 行 ‘to walk’, tiu³ 跳 ‘to jump’, paa⁴ 爬 ‘to climb’, and jau⁴ 游 ‘to swim’ are the main verbs in the sentences, specifying the manner in which the movements are carried out. They cannot introduce a locative object. Instead, a directional complement is used as a link between the main verb and the locative object. It should be noted that in these self-agentive sentences, the action verb can be omitted without giving rise to ungrammaticality, while the presence of the directional complement is necessary. On the other hand, the locative object after a non-deictic directional complement, in general, cannot be omitted while that after a deictic one can be.36

The directional complements soeng⁵ 上 ‘to ascend’, lok⁶ 落 ‘to descend’, ceot¹ 出 ‘to exit’, jap⁶ 入 ‘to enter’ and gwo³ 過 ‘to pass’ can introduce a path object.37 For example,

(69) 佢跑緊上樓梯。  
Keoi⁵ paau² gan² soeng⁵ lau¹ tai¹.  
s/he run ASP ascend staircase  
’S/he is running up along the staircase.’

^35 Instead of appearing after the main verb, zo² 咭 follows the verb and the directional complement dou³ 到 ‘to arrive’.
^36 It is mentioned in fn.22 that the same contrast is observed in non-deictic and deictic directional verbs.
^37 Please refer to (29)-(33) for the introduction of a path object by these five directional verbs.
Carine Yuk-man Yiu

(70) 佢跑緊落樓梯。
Keoi⁵ paau² gan² lok⁶ lau⁴ tai¹.
S/he run ASP descend staircase
‘S/he is running down along the staircase.’

(71) 佢跑咗出閘。
Keoi⁵ paau² zo² ceot¹ zaap⁶.
S/he run ASP exit gate
‘S/he ran out through the gate.’

(72) 佢跑咗入後閘。
Keoi⁵ paau² zo² jap⁶ zaap⁶.
S/he run ASP enter gate
‘S/he ran in through the gate.’

(73) 佢游咗過河。
Keoi⁵ jau⁴ zo² gwo³ ho⁴.
S/he swim ASP pass river
‘S/he swam across the river.’

The directional complements soeng⁵ ‘to ascend’, lok⁶ ‘to descend’ and ceot¹ ‘to exit’ can also introduce a locative object which indicates the source of the movement.³⁸ For example,

(74) 佢跳咗上水。
Keoi⁵ tiu³ zo² soeng⁵ seoi².
S/he jump ASP ascend water
‘S/he jumped up from the water (to the shore).’

(75) 佢跳咗落車。
Keoi⁵ tiu³ zo² lok⁶ ce¹.
S/he jump ASP descend car
‘S/he jumped out from the car.’

(76) 佢走咗出課室。
Keoi⁵ zau² zo² ceot¹ fo³ sat¹.
S/he run ASP exit classroom
‘S/he ran out from the classroom.’

³⁸ Please refer to (38)-(40) for the introduction of a source object by these three directional verbs.
5.2 Agentive motion events

In agentive motion events, the co-event verb indicates the cause of the movement which is instigated by the agent subject and which brings about the change of location of the theme object. The simple directional complement specifies the direction of the movement undergone by the theme object that follows. Locative objects are often not involved. 39

(77) 佢打落咗三架戰機。
Keoi⁵ daa² lok⁶ zo² saam¹ gaa³ zin³ gei¹.
‘s/he hit descend ASP three CL rival plane
‘S/he shot down three rival planes.’

(78) 佢踢出咗一個波。
Keoi⁵ tek³ ceot¹ zo² jat¹ go³ bo¹.
‘s/he kick exit ASP one CL ball
‘S/he kicked out one ball.’

(79) 佢射入咗三球。
Keoi⁵ se⁶ jap⁶ zo² saam¹ kau⁴.
‘s/he shoot enter ASP three ball
‘S/he shot in three balls.’

(80) 佢推開咗張檯。
Keoi⁵ teoi¹ hoi¹ zo² zoeng¹ toi².
‘s/he push depart ASP CL table
‘S/he pushed away the table.’

(81) 佢拉埋咗張檯。
Keoi⁵ laai¹ maai⁴ zo² zoeng¹ toi².
‘s/he pull approach ASP CL table
‘S/he pulled the table close to a certain location.’

(82) 佢拉過咗張檯。
Keoi⁵ laai¹ gwo³ di¹ zoeng¹ toi².
‘s/he pull pass CL CL table
‘S/he pulled the table past a certain location a little bit.’

39 The directional complement soeng⁵ ‘to ascend’ often expresses a metaphorical meaning when it is followed by a theme object, e.g. oi⁵ soeng⁵ Hon⁴ kek⁶ ‘to fall in love with Korean movies’ while dou³ ‘to arrive’ can hardly be followed by a theme object. Therefore, they are excluded here.
There are three major differences exhibited in the use of the simple directional complement in self-agentive and agentive motion events. First, the verb and the simple directional complement do not form a compound in the former but they do in the latter. Such a contrast can be shown by the different positions in which the aspectual suffix  положительн

sad appears. In self-agentive motion events, the verb and the simple directional complement, except for стоя to ‘arrive’, do not form a compound and لزمsad appears between them. In agentive motion events, the verb and the simple directional complement form a compound and لزمsad occurs after the compound. Second, the former involves a theme subject and a locative object while the latter has an agent subject and a theme object, a pattern of semantic roles that is also exhibited in directional verbs, as shown in Table 5. Third, the omission of the main verb is possible in the former, but is, in general, not allowed in the latter. The above differences suggest that different structures are

40 It might be argued that ยู ‘to come’ in ยู ‘to bring and toward the speaker’ might express a metaphorical meaning rather than a directional meaning. However, since a locative object can be added to indicate the location to which the trouble was brought, it is assumed that ยู ‘to come’ expresses a directional meaning in (85) (cf. (94)).

41 There are exceptions in which the omission of the co-event verb is possible in sentences that express agentive motion events. For example, in ยู enter-ASP-CL-ball ‘shot in a ball’, the verb or the complement can be omitted without giving rise to ungrammaticality (e.g. ยู shoot-ASP-CL-ball ‘shot a ball’ and ยู enter-ASP-CL-ball ‘shot in a ball’).
involved in the two kinds of motion events, as illustrated schematically in Figure 2 below:

Self-agentive  
\[
\text{[Theme subject + [VP [Main verb + \text{zo}^2 + \text{Locative object}]]]}
\]

Agentive  
\[
\text{[Agent subject + [VP [Main verb + Directional complement + \text{zo}^2] + \text{Theme object}]]}
\]

**Figure 2:** Two structures exhibited in self-agentive and agentive motion sentences

In the above examples of agentive motion events, the goal of the movement is implied but not explicitly specified. If the destination of the theme object is to be stressed, the verb-directional compound can be restructured as the verb complement construction in which the co-event verb is followed by the theme object, which is in turn followed by the directional complement and the locative object.

(87) 佢打咗三架戰機落海。  
Keoi⁵ daa² zo² saam¹ gaa³ zin³ gei¹ lok⁶ hoi².  
S/he hit ASP three CL plane descend sea  
’S/he shot three planes down into the sea.’

(88) 佢踢咗一個波出界。  
Keoi⁵ tek³ zo² jat¹ go¹ ceot¹ gaai³.  
S/he kick ASP one CL ball exit boundary  
’S/he kicked a ball out of the sideline.’

(89) 佢射咗三球入門。  
Keoi⁵ se⁶ zo² saam¹ kau⁴ jap⁶ mun⁴.  
S/he shoot ASP three ball enter goal  
’S/he shot three balls into the goal.’

(90) 佢拉咗張檯開去。  
Keoi⁵ laai² zo² zoeng¹ toi² hoi¹ heoi³.  
S/he pull ASP CL table depart go  
’S/he pushed the table away from here.’

(91) 佢拉咗張檯埋牆。  
Keoi⁵ laai² zo² zoeng¹ toi² maai⁴ coeng⁴.  
S/he pull ASP CL table approach wall  
’S/he pulled the table close to the wall.’
Although lai⁴ 嘔 ‘to come’ and heoi³ 去 ‘to go’ can be combined with the main verb to form a compound word (cf. (85) and (86)), it is more natural for them to appear after the theme object, as shown in (98) and (99). Furthermore, the simple directional complements lai⁴ 嘔 ‘to come’ and heoi³ 去 ‘to go’ can only be combined with a small number of verbs to form a compound.⁴² For example,

4² Besides daai³ 帶 ‘to bring’, it is hard to come up with another verb which can be combined with lai⁴ 嘔 ‘to come’ to form a compound. On the other hand, the V-heoi³ 去 compounds might also include sat heoi³ 失去 ‘to lose’, ceoi³ heoi³ 除去 ‘to remove’, gaam⁷ heoi³ 滅去 ‘to subtract’, compounds which are lexicalized and cannot be restructured as a verb-object-complement-(locative object) construction. It seems that V-lai⁴ 嘔/heoi³ 去 compounds are more often used in a formal context such as news reports than in daily conversations. Therefore, they might have entered Cantonese as a result of influence from Mandarin. On the other hand, J. Wang (2006) observes that there is a strong tendency for lai⁴ 嘔 ‘to come’ and qù 去 ‘to go’ in Zhuzi Yulei 朱子語類, which is a collection of discussions between the Southern Song neo-Confucian philosopher Zhuxi 朱熹 and his disciples, to occur in the sentence-final position, a phenomenon which is identical to that found in Cantonese. Therefore, it is possible that such a characteristic observed in Zhuzi Yulei, i.e. the tendency for lai⁴ 嘔 ‘to come’ and qù 去 ‘to go’ to occupy the sentence-final position, has been preserved in Cantonese.
In examples (96) and (97), the sentences are ungrammatical. The simple directional complements \textit{lai}⁴来 ‘to come’ and \textit{heoi}³去 ‘to go’ cannot follow the verbs \textit{ning}¹挼 ‘to bring’ and \textit{sung}³送 ‘to send’. In examples (98) and (99), when the two deictic directional complements appear in the sentence-final position, the sentences become grammatical. The above contrast in grammaticality shows that the simple directional complements \textit{lai}⁴来 ‘to come’ and \textit{heoi}³去 ‘to go’ cannot be randomly combined with any verb to form a compound, and always tend to appear in sentence-final position.

The two word-order patterns illustrated in agentive motion are schematically represented in Figure 3 below:

\[
\text{Figure 3: Two word-order patterns exhibited in agentive motion sentences}
\]

Section 5 has illustrated the use of simple directional complements to encode path in both self-agentive and agentive motion events, a characteristic which is exemplified in satellite-framed languages. The next section will show the expression of path in compound directional complements. While both Cantonese and Mandarin allow the use
of compound directional complements which consist of two simple directional complements, only the former exhibits the use of compound directional complements that are made up of three simple directional complements.

6. The use of compound directional complements in Cantonese

A compound directional complement is a complement which consists of two or three simple directional complements. The order in which the simple directional complements are combined is fixed with the non-deictic directional complement(s) preceding the deictic one. Similar to simple directional complements, compound directional complements are used in self-agentive and agentive motion events to denote path. On the other hand, compound directional complements differ from the simple directional complements in that the former and the verb do not form a compound while the latter and the verb might.

6.1 Self-agentive motion events

In a self-agentive motion event, the main verb denotes the manner in which the movement is carried out by the theme subject while the compound directional complements denote the spatial configuration of the trajectory traversed by the theme subject.

(100) 佢跑咗上嚟/去(三樓)。
Keoi⁵ paau² zo² soeng⁵ lai⁴/heoi³ (saam¹ lau²).
s/he run ASP ascend come/go third floor
‘S/he ran up here/there (to the third floor).’

(101) 佢跑咗落嚟/去(三樓)。
Keoi⁵ paau² zo² lok⁶ lai⁴/heoi³ (saam¹ lau²).
s/he run ASP descend come/go third floor
‘S/he ran down here/there (to the third floor).’

(102) 佢行咗出嚟/去(客廳)。
Keoi⁵ haang⁴ zo² ceot¹ lai⁴/heoi³ (haak³teng¹).
s/he walk ASP exit come/go living room
‘S/he walked out here/there (to the living room).’

43 The discussion of compound directional complements in this study follows the classification of simple directional complements in Cheung (2007). Please refer to §2 for further details on Cheung’s classification.
(103) 佢行咗入嚟/去(睡房)。
Keoi⁵ haang⁴ zo² jap⁶ lai⁴/heoi³ (seoi⁶ fong²).
s/he walk ASP enter come/go bedroom
‘S/he walked into here/there (into the bedroom).’

(104) 佢跑咗開嚟/去(張檯度)。
Keoi⁵ paau² zo² hoi¹ lai⁴/heoi³ (zoeng¹ toi² dou⁶).
s/he run ASP depart come/go CL table LOC
‘S/he ran away to here/there (to the table).’

(105) 佢企咗埋嚟/去(張檯度)。
Keoi⁵ kei⁵ zo² maa¹ lai⁴/heoi³ (zoeng¹ toi² dou⁶).
s/he stand ASP approach come/go CL table LOC
‘S/he stood close to here/there (to the table).’

(106) 佢行咗過嚟/去(辦公室)。
Keoi⁵ haang⁴ zo² gwo³ lai⁴/heoi³ (baan⁶ gung¹ sat¹).
s/he walk ASP pass come/go office
‘S/he walked over here/there (to the office).’

(107) 佢行咗到嚟/去學校。
Keoi⁵ haang⁴ dou³ lai⁴/heoi³ (hok⁶ haau⁶).
s/he walk arrive come/go school
‘S/he arrived here/there (at the school).’

(108) 佢游咗翻嚟/去(岸邊)。
Keoi⁵ jau⁴ zo² faan¹ lai⁴/heoi³ (ngon⁶ bin¹).
s/he swim ASP return come/go shore side
‘S/he swam back here/there (to the shore).’

In the above examples, the subjects bear the role of theme, whose movements are of concern, whereas the optional objects indicate the destinations of the movements. While the non-deictic complements provide information regarding the spatial configurations of the movements, lai⁴嚟 ‘to come’ and heoi³去 ‘to go’ indicate whether the movement is toward or away from the speaker. Co-event verbs are used to specify the manner in which the movements are carried out and can be omitted.

44 It is unnatural to insert zo²咗 between the verb haang⁴行 ‘to walk’ and the double directional complement. However, based on the situations observed in other double directional complements, it will be assumed that dou¹ lai⁴/heoi³到嚟/去 arrive-come/go ‘to arrive here/there’ and the verb do not form a compound.
As mentioned above, *lai⁴ 嚟 ‘to come’ and *heoi³ 去 ‘to go’ have an implied speaker orientation point while the non-deictic directional verbs lack it. In the former, unless the location of the speaker is stressed, a locative object, and more specifically one that denotes the goal of the movement, need not appear after the deictic directional complement. In the latter, the orientation point is defined in relation to a physical location which is indicated by a locative object. As a result, the locative object of a non-deictic directional complement, in general, cannot be omitted. With the presence of *lai⁴ 嚟 ‘to come’ or *heoi³ 去 ‘to go’ as the last member in a compound directional complement, a locative object becomes optional after the compound directional complement.

The following examples illustrate the use of triple directional complements in self-agentive motion events.

(109) 佢跑咗翻上嚟/去(三樓)。
Keoi⁵ paau² zo² faan¹ soeng⁵ lai⁴/heoi³ (saam¹ lau²).
s/he run ASP return ascend come/go third floor
’S/he ran back up here/there (to the third floor).’

(110) 佢跑咗翻落嚟/去(三樓)。
Keoi⁵ paau² zo² faan¹ lok⁶ lai⁴/heoi³ (saam¹ lau²).
s/he run ASP return descend come/go third floor
’S/he ran back down here/there (to the third floor).’

(111) 佢行咗翻出嚟/去(客廳)。
Keoi⁵ haang⁴ zo² faan¹ ceot¹ lai⁴/heoi³ (haak³teng¹).
s/he walk ASP return exit come/go living room
’S/he walked back out here/there (to the living room).’

(112) 佢行咗翻入嚟/去(睡房)。
Keoi⁵ haang⁴ zo² faan¹ jap⁶ lai⁴/heoi³ (seo⁶fong²).
s/he walk ASP return enter come/go bedroom
’S/he walked back in here/there (to the bedroom).’

(113) 佢行咗翻開嚟/去(張檯度)。
Keoi⁵ haang⁴ zo² faan¹ hoi¹ lai⁴/heoi³ (zoeng¹ toi² dou⁶).
s/he walk ASP return depart come/go CL table LOC
’S/he walked away back here/there (to the table).’

(114) 佢企咗翻埋嚟/去(張檯度)。
Keoi⁵ kei⁵ zo² faan¹ maai⁴ lai⁴/heoi³ (zoeng¹ toi² dou⁶).
s/he stand ASP return approach come/go CL table LOC
’S/he stood back close to here/there (to the table).’
The Type 3 directional complement faan¹ 翻 ‘to return’ is added to the double directional complements to derive the triple directional complements, indicating that the movement is oriented back to the location from which the theme subjects have moved away at an earlier time; the Type 2 directional complements provide information regarding the spatial configurations of the movements; and the Type 1 complements lai⁴ 去 ‘to come’ and heoi³ 去 ‘to go’ define the direction of the movement in relation to the location of the speaker, appearing in the outermost position. The co-event verbs in the above self-agentive motion sentences describe the manner in which the movements are carried out.

6.2 Agentive motion events

In an agentive motion event, the co-event verb refers to the cause instigated by the agent subject, which leads to the change of location of the theme object, while the compound directional complement specifies the direction of the movement. The following examples illustrate the use of double directional complements in agentive motion events.⁴⁵

---

⁴⁵ When a theme object is present, it appears between hei² 起 ‘to rise’ and lai⁴ 去 ‘to come’, e.g. ning¹ hei² bun² syu¹ lai⁴ 擡起本書嘅 pick-rise-CL-book-come ‘to pick up the book’, rather than after the main verb as in the cases of other double directional complements, e.g. ning¹ bun² syu¹ soeng⁵ lai⁴ 擡本書嘅 pick-CL-book-ascend-come ‘to pick up the book’. On the other hand, a reviewer has pointed out that sentences in which hei² lai⁴ 起嘅 ‘to rise and to come’ occurs after an object such as pou² zek³ gung¹ zai² hei² lai⁴ 抱隻公仔起嘅 carry-CL-stuffed animal-rise-come ‘to lift up the stuffed animal’ should not be ruled out. However, the occurrence of a locative object after hei² lai⁴ 起嘅 ‘to rise and to come’, i.e. ??pou² zek³ gung¹ zai² hei² lai⁴ toi² dou⁶ 抱隻公仔起嘅檯度 carry-CL-stuffed animal-rise-come-table-LOC ‘to lift the stuffed animal up to the table’, sounds awkward. In contrast, the occurrence of a locative object after a double directional complement is allowed, e.g. ning¹ bun² syu¹ soeng⁵ lai⁴ toi² dou⁶ 擡本書上嘅檯度 pick-CL-book-ascend-come-table-LOC ‘to pick the book up here to the table’. Since hei² lai⁴ 起嘅 ‘to rise and to come’ exhibits properties that are different from double directional complements, it is highly likely that hei² lai⁴ 起嘅 ‘to rise and to come’ is not a double directional complement and is excluded here. Please refer to Yiu (2008) for a discussion on the comparison between hei² lai⁴ 起嘅 ‘to rise and to come’ and double directional complements.
(116) 佢搬咗啲貨上嚟/去(貨架)。
Keoi⁵ bun¹ zo² di¹ fo³ soeng⁵ lai⁴/heoi³ (fo³ gaa²).
s/he move ASP CL goods ascend come/go (goods shelf)
’S/he moved the goods up here/there (onto the shelf).’

(117) 佢搬咗啲貨落嚟/去(樓下)。
Keoi⁵ bun¹ zo² di¹ fo³ lok⁶ lai⁴/heoi³ (lau⁴ haa⁶).
s/he move ASP CL goods descend come/go (downstairs)
’S/he moved the goods down here/there (to downstairs).’

(118) 佢揸咗架船出嚟/去(海中心)。
Keoi⁵ zaa¹ zo² gaa³ syun⁴ ceot¹ lai⁴/heoi³ (hoi² zung¹ sam¹).
s/he drive ASP CL ship exit come/go (sea center)
’S/he sailed the ship out here/there (to the deep water).’

(119) 佢搬咗啲貨入嚟/去(貨倉)。
Keoi⁵ bun¹ zo² di¹ fo³ jap⁶ lai⁴/heoi³ (fo³ coeng¹).
s/he move ASP CL goods enter come/go (warehouse)
’S/he moved the goods into here/there (to the warehouse).’

(120) 佢泊咗架船開嚟/去(碼頭)。
Keoi⁵ paak³ zo² gaa³ syun⁴ hoi¹ lai⁴/heoi³ (maa⁵ tau⁴).
s/he anchor ASP CL ship depart come/go (pier)
’S/he anchored the ship over here/there (at the pier).’

(121) 佢泊咗架船埋嚟/去(碼頭)。
Keoi⁵ paak³ zo² gaa³ syun³ maai⁴ lai⁴/heoi³ (maa⁵ tau⁴).
s/he anchor ASP CL ship approach come/go (pier)
’S/he anchored the ship close to here/there (to the pier).’

(122) 佢揸咗架巴士過嚟/去(車房)。
Keoi⁵ zaa¹ zo² gaa³ baa³ si² gwo³ lai⁴/heoi³ (ce¹ fong⁴).
s/he drive ASP CL bus pass come/go (garage)
’S/he drove the bus over here/there (to the garage).’

(123) 佢還咗本書翻嚟/去(圖書館)。
Keoi⁵ waan⁴ zo² bun² syu¹ faan¹ lai⁴/heoi³ (tou⁴ syu¹ gun²).
s/he return ASP CL book return come/go (library)
’S/he returned the book back here/there (to the library).’

In the above examples, the co-event verb is followed by the theme object which is, in turn followed by a double directional complement and an optional locative object.
The following examples show the use of triple directional complements in agentive motion events.

(124) 佢搬咗啲貨翻上嚟/去(貨架)。
Keoi⁵ bun¹ zo² di¹ fo³ faan¹ soeng⁵ lai⁴/heoi³ (fo³ gaa²).
s/he move ASP CL goods return ascend come/go (goods shelf)
‘S/he moved the goods back up here/there (onto the shelf).’

(125) 佢搬咗啲貨翻落嚟/去(樓下)。
Keoi⁵ bun¹ zo² di¹ fo³ faan¹ lok⁶ lai⁴/heoi³ (lau⁴ haa⁶).
s/he move ASP CL goods return descend come/go (downstairs)
‘S/he moved the goods back down here/there (to downstairs).’

(126) 佢揸咗架船翻出嚟/去(海中心)。
Keoi⁵ zaa¹ zo² gaa³ syun⁴ faan¹ ceot¹ lai⁴/heoi³ (hoi² zung¹ sam¹).
s/he drive ASP CL ship return exit come/go (sea center)
‘S/he sailed the ship back out here/there (to the deep water).’

(127) 佢搬咗啲貨翻入嚟/去(貨倉)。
Keoi⁵ bun¹ zo² di¹ fo³ faan¹ jap⁶ lai⁴/heoi³ (fo³ coeng¹).
s/he move ASP CL goods return enter come/go (warehouse)
‘S/he moved the goods back into here/there (to the warehouse).’

(128) 佢泊咗架船翻開嚟/去(碼頭)。
Keoi⁵ paak³ zo² gaa³ syun⁴ faan¹ hoi¹ lai⁴/heoi³ (maa⁵ tau⁴).
s/he anchor ASP CL ship return depart come/go (pier)
‘S/he anchored the ship back over here/there (at the pier).’

(129) 佢泊咗架船翻埋嚟/去(碼頭)。
Keoi⁵ paak³ zo² gaa³ syun⁴ faan¹ maai⁴ lai⁴/heoi³ (maa⁵ tau⁴).
s/he anchor ASP CL ship return approach come/go (pier)
‘S/he anchored the ship back close to here/there (at the pier).’

(130) 佢揸咗架車翻過嚟/去(車房)。
Keoi⁵ zaa¹ zo² gaa³ baa¹ si² faan¹ gwo³ lai⁴/heoi³ (ce¹ fong⁴).
s/he drive ASP CL bus return pass come/go (garage)
‘S/he drove the car back over here/there (to the garage).’

The structures exhibited by compound directional complements in sentences that encode self-agentive and agentive motion events are schematically represented in Figure 4 below:
Figure 4: Structures exhibited by compound directional complements in self-agentive and agentive motion sentences

Figure 4 shows that in both types of motion events, the compound directional complement and the main verb do not form a compound, a possibility that exists when simple directional complements are used to express path in agentive motion events (cf. Figure 3). As a result, an aspectual suffix follows immediately after the main verb and before the compound directional complement.

Sections 3-6 have provided a detailed description of the characteristics of directional verbs and the use of directional verbs and directional complements (including both simple and compound ones) in Cantonese. It is demonstrated that Cantonese exhibits both characteristics of verb-framed and satellite-framed languages in encoding path in the verb or in the satellite. In the next section, two issues will be addressed. First, how does Cantonese fit into Talmy’s typology of motion events? Second, how are the differences exhibited by Cantonese and Mandarin accounted for?

7. Discussion

Lamarre (2003) notes that one major difference between Chinese and verb-framed languages such as Japanese and French is that an agentive motion event is expressed by a combination of a co-event verb and a path satellite in Chinese but by a single path verb in Japanese and French.

\[
\text{(131) } \quad \text{doraibuwei ni kuruma-o ireta} \\
\text{garage at car-ACC enter} \\
\text{‘...drove the car into a garage...’}
\]

\[
\text{(132) } \quad \text{Je vais sortir la voiture du garage.} \\
\text{I will exit the car from the garage} \\
\text{‘I will drive the car out from the garage.’}
\]

The Japanese path verb \textit{ireru} ‘to enter’ in (131) and the French path verb \textit{sortir} ‘to exit’ in (132) express the meaning of causing X, i.e. the car, to move in a certain direction, i.e. into the garage and out from the garage. However, path verbs such as \textit{jin} 進 ‘to enter’ in
Chinese lack such an agentive use (cf. (133)). Instead, a combination of a co-event verb and a directional complement such as antas 放 ‘to put’ and jin 進 ‘to enter’ is used (cf. (134)).

(133) 他進了信在信封裡。
Tā jìn le xìn zài xīnfēng lǐ.
‘He put the letter into the envelope.’

(134) 他把信放進了信封。
Tā bǎ xìn fàng jìn le xīnfēng lǐ.
‘He put the letter into the envelope.’

In contrast, Cantonese stands out from Mandarin in having a group of path verbs which exhibits the agentive use.

(135) 佢入咗封信喺信封。
Keoi 5 jap 6 zo² fung¹ seon³ hai² seon³ fung¹.
s/he enter ASP CL letter at envelope
‘S/he put the letter into the envelope.’

(136) 佢放咗封信入信封。
Keoi 5 fong³ zo² fung¹ seon³ jap⁶ seon³ fung¹.
s/he put ASP CL letter enter envelope
‘S/he put the letter into the envelope.’

Examples (135) and (136) illustrate that Cantonese has an option of encoding path in a main verb or in a directional complement in agentive motion events.

Table 6 below summarizes the ways in which path is expressed in self-agentive and agentive motion events in Cantonese and Mandarin.

Table 6: Expression of path in self agentive and agentive motion events in Cantonese and Mandarin
In Table 6, it is shown that both Cantonese and Mandarin can express path in a verb or in a directional complement in self-agentive motion events. The two dialects, however, differ significantly in encoding path in agentive motion events. While Cantonese can use a single directional verb or a combination of a co-event verb and a directional complement to denote an agentive motion event, only the latter is allowed in Mandarin. The question that immediately arises is why directional verbs in Cantonese exhibit an agentive use but those in Mandarin do not.

Scholars (cf. Li 1993, Xu 2006, Ma 2008, Peyraube 2009) have shown that Classical Chinese underwent a typological change from a verb-framed language to a satellite-framed language. For example, chū 出 ‘to exit’ in Classical Chinese could be used to denote path in self-agentive and agentive motion events, uses which are identical to those observed in directional verbs in Cantonese.

(137) 既醉而出… (Shijing 詩經 220)46
Jì zuì ér chū…
already drunk and go-out
‘If they, when drunk, go out (retire)…’

(138) 我出我車… (Shijing 詩經 168)
Wǒ chuì wǒ jū…
we bring-out our carriage
‘We bring out our carriages…’

Example (137) denotes a self-agentive motion event and chū 出 ‘to exit’ indicates the movement undergone by the subject. Example (138) refers to an agentive motion event and chuì 出 ‘to exit’ expresses the meaning of causing the object wǒ jū 我車 ‘our carriages’ to move from the inside to the outside. The striking similarity between Cantonese and Classical Chinese in terms of the use of directional verbs in agentive motion events suggests that although both are descendants of the same ancestral language, Cantonese has retained more characteristics of Classical Chinese than Mandarin. In particular, while the use of directional verbs in self-agentive motion events has been preserved in both dialects, the corresponding agentive use has been kept in Cantonese but has become obsolete in Mandarin. As a result, the verb complement construction (such as găn chū 趕出 ‘to expel’) is the only way used in Mandarin to express the agentive meaning originally conveyed by directional verbs in Classical Chinese, an option which is still available in Cantonese. The picture which emerges from the above

46 Examples (137) and (138) are taken from Xu (2006:65), according to whom the pronunciations of 出 are different when expressing a self-agitve event and an agentive event, i.e. chū vs. chuì.
discussion is that Classical Chinese, as claimed by scholars, was a verb-framed language and it underwent a typological shift to a satellite-framed language. Being descendants of Classical Chinese, Cantonese has progressed slower than Mandarin in becoming a satellite-framed language. It is further noticed that both Cantonese and Classical Chinese are largely monosyllabic while Mandarin is increasingly disyllabic, a contrast which seems to be correlated with the availability of the agentive use. For example, some monosyllabic adjectives in Cantonese can also be used as a main verb denoting change of state in agentive events such as 

\[ \text{gon}^1 \text{ zo}^2 \text{ di}^1 \text{ saam}^1 \text{乾咗啲衫} \text{dry-ASP-CL-shirt} \] ‘dried the clothes’. However, such an agentive use is not observed in disyllabic adjectives such as \[ *\text{gon}^1 \text{zeng}^6 \text{ go}^3 \text{ de}^6 \text{乾淨個地} \text{clean-CL-floor} \] ‘to clean the floor’. Furthermore, one of the factors that contributed to the rise of the verb complement construction in Classical Chinese was the disappearance of the causative use of verbs (cf. Mei 1991, Jiang 2000), a process during which causation, which was originally expressed by a monosyllabic element, has gradually been conveyed by a disyllabic complex predicate. If our speculation that syllabicity correlates with the causative use turns out to be true, it would help explain why Mandarin – which is becoming disyllabic – lacks it, while Cantonese – which is basically monosyllabic – exhibits it.

Croft et al. (2010) illustrate that the languages they have examined (including Bulgarian, Japanese, Icelandic, Dutch, and English) use more than one of Talmy’s types to encode complex events. For example, Japanese, a verb-framed language according to Talmy (2000b), uses a number of strategies to express directed motion events, including the satellite framing construction, compounding and coordination.

(139) Watashi wa ie ni kake-konda.48
I TOP house to run-go.into:PST ‘I ran into the house.’ (Croft et al. 2010:218, ex.(79a))

(140) Bin ga doukutsu no naka ni ukande-itta.
bottle NOM cave GEN inside to float-go:PST ‘The bottle floated to the inside of the cave.’ (Croft et al. 2010:218, ex.(80a))

47 Masini (1993:121) notes that in (1649) Shuihuzhuan 水滸傳, (1765) Hongloumeng 紅樓夢 and (1840) Ernu yingxiong zhuan 兒女英雄傳, the ratio between monosyllables and polysyllables is approximately 1:1. The ratio stays more or less the same in (1935) Luotuo Xiangzi 駱駝祥子, but has increased drastically in the literary works written after 1949, in which the ratio between monosyllables and polysyllables is 14.2% and 85.8% (of which 73.7% are disyllables).

48 Croft et al. (2010) note that a te-compound hashitte-haitta ‘run-went into’ can also be used in this example. However, the one with an i-compound is more pervasive and more natural.
I rolled the barrel into the basement.' (Croft et al. 2010:219, ex.(87))

Moreover, Croft et al. propose adding two new types, i.e. symmetrical framing and double framing languages, to Talmy’s two-way classification. Symmetrical framing is proposed to encompass serial verb languages in which both event and frame are expressed in forms that may occur as predicates on their own. It further consists of three sub-types: serial strategy, compounding, and coordination. Mandarin is used by the authors to illustrate the use of the serial strategy to express the core schema and the co-event. For example,

(142) 他們跑出來了。
Tāmen pāo chū lái le.
they run exit come SFP
‘They came running out.’

In the above example, the verb pāo 跑 ‘to run’ expresses manner while the directional complements chū 出 ‘to exit’ and lái 來 ‘to come’ denote the non-deictic and the deictic path. All of them can occur as predicates on their own, as illustrated in the following examples:

(143) 他們還在跑。
Tāmen háizài pāo.
they still run
‘They are still running.’

(144) 他出了教室。
Tā chū le jiàoshì.
he exit ASP classroom
‘He exited from the classroom.’

(145) 他來了。
Tā lái le.
he come SFP
‘He came.’

Symmetrical framing includes the use of two single verbs in serial verb languages, the use of a compound verb in bipartite verb languages and the use of two preverbs in Jaminjungan languages. It is equivalent to the equipollently framing proposed by some scholars (cf. Slobin & Hoiting 1994, Slobin 2004, Zlatev & Yangklang 2004).
According to Croft et al. (2010), compounding is more grammaticalized than the serial strategy. The forms that express the core schema and the co-event in the former are morphologically bound or more tightly integrated than those in the latter. The compounding strategy is used in Kiowa. For example,

      nearer rain reach-come and.DS clearly get.wet.PF
‘The rain is coming closer and it is clear we shall get wet.’ (Croft et al. 2010:207, ex.(27))

In the above example, the path component is expressed by cândé ‘to reach’ and the deictic component by -ǎ: ‘to come’, and together the two form a compound.

The third sub-type of symmetrical framing is coordination. Amele uses a combination which involves the path component and the deictic component to express a complex event. For example,

(147) Cois hina gad cesel-i nu-ug-a.
      OK 2SG may return-PRED(SS) go-2SG-IMP

The other new type proposed is the double framing construction, as illustrated by the following Russian example, in which the path and the framing expressions are expressed by the satellite, i.e. iz ‘from’, and by part of the path verb, i.e. vy ‘out’.

(148) Ja vy-bežal iz doma.
      I out-ran from house:GEN
‘I ran out of the house.’ (Talmy 1985:105 quoted in Croft et al. 2010:208, ex.(30))

Croft et al. further point out that the different strategies adopted by languages for the expression of motion events appear to represent a grammaticalization path of morphosyntactic integration which reflects event integration. The following two grammaticalization paths which end in univerbation of the event and the frame morphemes emerge from their study.

(149) Coordination > Serialization > Satellite framing > Verb Satellite fusion
(150) Coordination > Verb framing > Verb Adverb fusion
The strategy/strategies on the right represent(s) a higher degree of morphosyntactic integration of elements than that/those on the left. Dutch and Japanese are used to illustrate the two paths.

As noted by the authors, it is not clear whether the directional satellites of Indo-European were originally serial verbs. However, there is evidence which shows that the satellites are attracted to the verb, leading to the fusion of both event and frame in a single predicate, as illustrated by the following examples from Dutch.

(151) De fles dreef de grot in.
the bottle floated the cave in
‘The bottle floated into the cave.’ (Croft et al. 2010:227, ex.(97))

(152) De fles is de grot in-gedreven.
the bottle is the cave in-floated
‘The bottle has floated into the cave.’ (Croft et al. 2010:227, ex.(98))

In ‘in’ in (151) is a path satellite in the simple past or present of a main clause without an auxiliary. In (152), when the auxiliary *is* ‘is’ is present, the path expression is prefixed to the manner verb *gedreven* ‘to float’, i.e. *in-gedreven* ‘to float in’.

The following examples from Japanese demonstrate the grammaticalization path in (150). Unlike Spanish, Japanese does not express manner or process in an adverbial verb. As a result, the process directly leads via verb framing constructions to verbal compound constructions.

Example (153) below illustrates the strategy of coordination:

(153) Kanojo wa arui te douro o yokogitta.
she TOP walk and street ACC cross:PST
‘She walked and crossed the street.’ (Croft et al. 2010:229, ex.(109a))

Example (153) represents a self-agentive motion event, in which the verbs *aruku* ‘to walk’ and *yokogiru* ‘to cross’ are linked by the conjunction *te* ‘and’.

Example (154) shows the strategy of compounding:

(154) Kanojo wa douro o aruite-yokogitta.
she TOP street ACC walk-cross:PST
‘She walked across the street.’ (Croft et al. 2010:229, ex.(109b))
The verbs *aruку* ‘to walk’ and *yokогиру* ‘to cross’ in (154) are fused together, becoming a compound.50

The grammaticalization path depicted in (149) is supported by the development of Chinese. Scholars (cf. Wang 1980[2001], Mei 1991, Jiang 2000, Peyraube 2009, Zhang & Li 2009) have suggested that the verb complement construction was derived from the serial verb construction, which in turn originated from the coordinate construction. For example, the phrase *qу ěр чу* 趨而出 ‘to move forward and to exit’ is a coordinate structure in which the verbs *qу* 趨 ‘to move forward’ and *чу* 出 ‘to exit’ are linked by the conjunction *ěр* 而 ‘and’. Later on, the coordinate verbs were reanalyzed as a serial verb structure and then a verb complement structure. In the latter two stages, *ěр* 而 ‘and’ could no longer be inserted between the verbs. Much discussion has been devoted to the timeframe during which Classical Chinese shifted from a verb-framed language to a satellite-framed language. In contrast, little attention has been given to the last stage in which the verb and the satellite are fused together, an issue which we now turn to.

As noted by Croft et al. (2010), the difference between the serial strategy and compounding is that the former is not as morphologically bound or at least less tightly integrated than the latter. It is pointed out in §5.2 that the aspectual suffix *zo2* 咋 in Cantonese appears after the verb and the complement when the complement denotes path in agentive motion events (cf. (155)).

(155) 佢射入咗一個波。
Keoi⁵ se⁶ jap⁶ zo² jat¹ go³ bo¹.
s/he shoot enter ASP one CL ball
‘S/he shot in one ball.’

In contrast, *zo2* 咋 occurs after the verb and before the directional complement in sentences that express self-agentive motion events (cf. (156)-(158)).

(156) 佢行咗入課室。
Keoi⁵ haang⁴ zo² jap⁶ fo³ sat¹.
s/he walk ASP enter classroom
‘S/he walked into the classroom.’

---

50 It seems that the contrast between the coordinate structure in (153) and the compound structure in (154) can be differentiated by the insertion of an object between the two verbs. In (153), *douро* ‘the street’ appears between the two verbs but it occurs before the two verbs in (154).
The following Mandarin example shows that the aspectual suffix *le* 了 appears after the verb and the complement in agentive motion sentences.

(159) 他踢進了一個球。
Tā tí jìn le yí ge qiú.
he kick enter ASP one CL ball
‘He kicked in a ball.’

Similarly, *le* 了 occurs after the verb and the complement in the following self-agentive motion sentence.

(160) 他走進了教室。
Tā zǒu jìn le jiàoshì.
he walk enter ASP classroom
‘He walked into the classroom.’

Mandarin does not allow the occurrence of a locative object after a compound directional complement, e.g. *tā zǒu shàng lái sān lóu* 他走上來三樓 he-walk-ascend-come-three-floor ‘He walked up here to the third floor.’ It seems that the ability of a directional verb, including both deictic and non-deictic directional verbs, to take a locative object in some dialects such as Pekingese and Wu has disappeared. Instead, *dào 到* ‘to arrive’ is much more frequently used in these dialects to introduce a postverbal locative object. In contrast, both deictic and non-deictic directional verbs in dialects such as Cantonese and Min can still have a locative object. The above contrast exemplified in the dialects might be a result of the change of argument structure. In particular, in some dialects, the argument structure of directional verbs has undergone structural change, and as a result, the directional verbs in these dialects can no longer take a locative object; while in other dialects, the argument structure of directional verbs has not undergone any change and the directional verbs can still have a locative object. Please refer to Lamarre (2009b) and Liu (2003) for a relevant discussion on the use of *dào 到* ‘to arrive’ to introduce a locative object in some Chinese dialects.
Additional evidence which shows that the relationship between the co-event verb and the directional complement in Cantonese is rather loose is shown by the possibility of separating the verb and the directional complement.52

(161) 佢踢入咗一個波。
Keoi⁵ tek³ jap⁶ zo² jat¹ go³ bo¹.
s/he kick enter ASP one CL ball
‘S/he kicked in a ball.’

(162) 佢踢咗一個波入龍門。
Keoi⁵ tek³ zo² jat¹ go³ bo¹ jap⁶ lung⁴ mun⁴.
s/he kick ASP one CL ball enter goal
‘S/he kicked a ball into the goal.’

While jap⁶ 入 ‘to enter’ in (161) indicates the resultant state of the object jat¹ go³ bo¹ 一個波 ‘a ball’, i.e. its location in the inside of an unspecified location, it indicates the inward movement undergone by the object and introduces the goal object lung⁴ mun⁴ 龍門 ‘the goal’ in (162).

It is further observed that it is possible for a compound directional complement to appear after the main verb and before the theme object in Mandarin.

(163) 他踢進來一個球。
Tā tī jìn lái yí ge qiú.
he kick enter come one CL ball
‘He kicked a ball into here.’

(164) 他踢進一個球來。
Tā tī jìn yí ge qiú lái.
he kick enter one CL ball come
‘He kicked a ball into here.’

(165) 踢一個球進來！
Tī yí ge qiú jìn lái!
kick one CL ball enter come
‘Kick a ball into here!’

52 Please refer to §5.2 for more examples on the alternation between verb-directional complement-object and verb-object-directional complement-locative object.
The compound directional complement *jin lái* 進來 ‘to enter and to come’ occurs after the verb and before the object in (163), but after both the verb and the object in (165). In (164), the object *yí ge qiú* 一個球 ‘a ball’ is inserted between *jin* 進 ‘to enter’ and *lái* 來 ‘to come’. Among the three word order patterns, only the one displayed in (165) is allowed in Cantonese.

(166) *佢踢入嚟一個波。
Keoi⁵ tek³ jap⁶ lai⁴ jat¹ go³ bo¹.
s/he kick enter come one CL ball
’S/he kicked a ball into here.’

(167) *佢踢入一個波嚟。
Keoi⁵ tek³ jap⁶ jat¹ go³ bo¹ lai⁴.
s/he kick enter one CL ball come
’S/he kicked a ball in here.’

(168) 佢踢一個波入嚟。
Keoi⁵ tek³ jat¹ go³ bo¹ jap⁶ lai⁴.
s/he kick one CL ball enter come
’S/he kicked a ball in here.’

Zhang (1991) points out that compound directional complements have emerged in the history of the standard language in the following chronological order: Stage I: V + O + DC + DC > Stage II: V + DC + O + DC > Stage III: V + DC + DC + O. While Mandarin has gone through all three stages, Cantonese is still lagging behind at Stage I. The contrasts between Cantonese and Mandarin in simple as well as compound directional complements suggest that the verb complement construction in Mandarin is more grammaticalized than that in Cantonese. Both simple and compound directional complements and the main verb in Mandarin form a compound. In contrast, only simple directional complements and the main verb have undergone the univerbation process when expressing agentive motion events in Cantonese. In all other cases, the simple and the compound directional complements have yet to be fused together in Cantonese.

---

Please refer to Zhang & Fang (1996) for a detailed discussion on the use of the three word orders exhibited by compound directional complements in Mandarin. Thanks to the reviewer for drawing my attention to the fact that in Northern Mandarin, the use of *V + O + DC + DC* is restricted to the irrealis mood. A similar point is also made in Zhang & Fang (1996). Moreover, according to them, *V + DC + O + DC* in general is interpreted as a declarative sentence while *V + DC + O + DC* can be interpreted as a declarative sentence or an imperative sentence.
Table 7 below summarizes the integration of the verb and the directional complement (including simple and compound directional complements) in self-agentive and agentive motion events in Cantonese and Mandarin.

**Table 7: Integration of the verb and the directional complement in self-agentive and agentive motion events in Cantonese and Mandarin**

In Table 7, it is demonstrated that Mandarin can use compounding to express path in both self-agentive and agentive motion events whether a simple or a compound directional complement is involved; while Cantonese might use compounding to encode path only in agentive motion events that involve simple directional complements. All in all, Mandarin has progressed much further on the grammaticalization path than Cantonese in combining the verb and the satellite together.

In §5.2, it is illustrated that two word-order patterns are exhibited in sentences that denote agentive motion events in Cantonese. Figure 3 is repeated below as Figure 5:

(i): [Agent subject + [VP [Main verb + Directional complement + zo² 呢] + [Theme object]]] OR

(ii): [Agent subject + [[[VP [Main verb + zo² 呢] + [Theme object]] + [Directional complement + Locative object]]]

**Figure 5:** Two word-order patterns exhibited in agentive motion sentences

While (i) illustrates that the main verb and the directional complement have been fused together as a compound, taking one theme object, (ii) shows the serial structure in which the main verb and the directional complement have their own object. The serial strategy is not as morphologically bound or at least less tightly integrated than compounding according to Croft et al. (2010). The question is how (i) is derived from (ii), an issue which is to be addressed below with data from early Cantonese, the Cantonese language spoken in the 19th and the early 20th centuries.

---

54 In Table 7, ‘☑️’ indicates that the integration of the verb and the complement is possible; ‘☒’ means that the integration is not possible; and ‘—’ means the integration is not relevant as a locative object cannot follow a compound directional complement in Mandarin.
Examples (169)-(173) represent the three stages the verb and the directional complement have to go through before they are fused together. Example (169) illustrates the first stage in which the verb 俗 放 ‘to put’ and the directional complement 落 落 ‘to descend’ appear in a serial verb sentence, each taking its own object. The second stage is shown in (170)-(172), during which the verb and the directional complement are juxtaposed, taking only a theme object or a locative object (cf. (170)-(171)). However, the relationship between the verb and the directional complement is still rather loose and they can still be restructured as a serial verb construction, as illustrated in (172). Example (173) represents the final stage in which the verb and the directional complement are fused together as one unit, subcategorizing for a theme object, and the locative object is introduced by 喺 喪 ‘at’. During the univerbation process, the meaning of the directional complement has changed. 落 落 in (170)-(172), for instance, does not denote a downward movement but emphasizes the resultant state after the downward movement, i.e. the location of the theme object after the movement. The three stages of the univerbation process can be summarized below:
Stage I: the co-event verb and the directional complement take their own object, i.e. a theme object and a locative object; the directional complement expresses a path meaning (cf. (169))

Stage II: the co-event verb and the directional complement are juxtaposed, taking either a theme object or a locative object; the directional complement denotes a resultative meaning (cf. (170)-(171), (173))

Stage III: the co-event verb and the directional complement are fused together, subcategorizing for a theme object and the locative object is introduced by a preposition or another directional complement

During the fusion process, it is observed that the removal of the theme object from the position after the co-event verb and before the directional complement is necessary for the process to take place.

(174) …人擰燈嚟，豈係擠落斗下
Jan⁴ ning¹ dang⁴ lai⁴, hei² hai⁶ zai¹ lok⁶ dau² haa⁶
man bring candle come why be put descend bushel below
‘Is a candle brought to be put under a bushel…’ (1872 Make Chuan Fuyinshu)

(175) 呢三條手巾收埋櫃處…
Nei¹ saam¹ tiu⁴ sau² gan¹ sau¹ maaï⁴ gwai⁶ cyu³...
these three CL handkerchief put approach wardrobe LOC
‘These three handkerchiefs, put in the wardrobe...’ (Fulton 1931)

In example (174), the noun dang¹ 燈 ‘a candle’ is the object of both ning¹ 擰 ‘to bring’ and zai¹ 擰 ‘to put’. It appears in the first clause and is omitted in the second clause. In example (175), the object nei¹ saam¹ tiu⁴ sau² gan¹ 呢三條手巾 ‘these three handkerchiefs’ is prefixed to the sentence-initial position. The omission of the object in both examples makes possible the juxtaposition and the fusion of the verb and the directional complement. The omission of the object is also frequently observed in early Cantonese.

55 This example from Dennys (1874): nei⁵ jau⁵ fong³ jap⁶ go² di¹ lok⁶ go² bun² syu¹ lai⁴ mou⁵ ne¹ you-have-put-enter-that-CL-descend-that-CL-book-SFP-have not-SFP 你有放入嘅啲落啲本書嘅呢 ‘Did you insert that in the book?’, shows that after the co-event verb fong³ 放 ‘to put’ and the directional complement jap⁶ 入 ‘to enter’ are fused together, taking the theme object go² di¹ 嘅啲 ‘that’, the directional complement lok⁶ 落 ‘to descend’ is used to introduce the locative object go² bun² syu¹ 嘅本書 ‘that book’.
Table 8: Number of tokens of presence and absence of theme object between the co-event verb and the directional complement

<table>
<thead>
<tr>
<th>with a theme object</th>
<th>上</th>
<th>落</th>
<th>出</th>
<th>入</th>
<th>埋</th>
<th>去</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3</td>
<td>12</td>
<td>0</td>
<td>6</td>
<td>0</td>
<td>29</td>
</tr>
<tr>
<td>without a theme object</td>
<td>3</td>
<td>36</td>
<td>1</td>
<td>9</td>
<td>9</td>
<td>27</td>
</tr>
</tbody>
</table>

Table 8 shows the presence and the absence of the theme object after the co-event verb and before the directional complement in the Early Cantonese Tagged Database. It is shown that for soeng 上 ‘to ascend’ and heoi 去 ‘to go’, the number of tokens of the presence and the absence of the theme object for the former is identical (3), whereas the number of tokens of the presence of a theme object for the latter is slightly higher than that of the absence of the theme object (29 vs. 27). In the remaining cases, the number of tokens of the absence of the theme object is higher than that of the presence of the theme object, especially in the cases of lok 落 ‘to descend’ and maai 埋 ‘to approach’. Table 8 illustrates that except for the cases of soeng 上 ‘to ascend’ and heoi 去 ‘to go’, the theme object is often omitted after the co-event verb and before the directional complement. As a result, the co-event verb and the directional complement can be juxtaposed, a pre-requisite which allows them to be further fused together.

8. Conclusion

This study has shown that the Cantonese directional verbs examined constitute a unique group, denoting movements with an inherently specified direction. They differentiate themselves from other verbs in the following aspects: (i) the expression of motion, (ii) the ability to take a locative object, and (iii) the potential to form compound directional complements. More importantly, some members of the group can be used to express path in agentive motion events, a use which is exemplified in verb-framed languages such as Japanese, French, and Classical Chinese, but which has rarely, if ever, been reported in other Chinese dialects. In expressing self-agentive motion events, both Cantonese and Mandarin exhibit the characteristics of verb-framed and satellite-framed languages.

56 Please refer to the following website for further details of the Early Cantonese Tagged Database: http://pvs0001.ust.hk/WTagging/
57 Verbal attraction is a process during which units being part of or forming arguments of the predicate are attracted to the verb and the endpoint is reached when the relevant unit either becomes a verbal affix or merges entirely with the verb (cf. Heine & Reh 1984:50). For self-agentive motion events in which a theme object is not involved, the directional complement might simply be attracted to the verb, giving rise to the fusion of the co-event verb and the directional complement, as illustrated in the case in Mandarin.
languages in using a single directional verb or a combination of a co-event verb and a directional complement to encode path. The two dialects differ significantly in the representation of agentive motion events. In particular, Cantonese can use a single directional verb to express path in agentive motion events but Mandarin cannot. Scholars have argued that Classical Chinese was a verb-framed language and underwent a typological shift to a satellite-framed language. Such a change, however, did not happen overnight and modern Chinese dialects seem to have participated in the change at their own pace with some closer to the finishing line than others. That Cantonese has progressed slower than Mandarin in becoming a satellite-framed language coincides with the different stages of grammaticalization that the two dialects have undergone in developing the verb-complement construction. Specifically, the degree of integration of the verb and the complement is higher in Mandarin than in Cantonese.
